CMT EDIE/PreManage ED Information Exchange

EDIE/PreManage integration provides deeper insights into transitions of care and service utilization behavior. These offerings improve exchange of outpatient visit information for better care coordination and a more efficient process for providers.

**OCHIN Epic Integration**

OCHIN has a partnership with Collective Medical Technologies (CMT) to bidirectionally exchange patient visit and discharge information and to seamlessly integrate our applications to provide better care coordination between hospitals and health systems and OCHIN member clinics.

This direct connection between OCHIN and CMT does not require integration through a regional HIE, which simplifies the process for providers and reduces costs to the overall health care system. This is consistent with the trend toward national frameworks that streamline the exchange of patient clinical data using existing infrastructure.

Integration with CMT includes:

- **Emergency Department Information Exchange (EDIE)**
  EDIE integration provides inpatient and Emergency Department discharge information directly within the EHR.

- **PreManage**
  PreManage integration allows care recommendations to be automatically updated from the EHR, and gives providers one-click access to care plan recommendations at the point of care. Providers can see patients by various categories of risk, which assists with opioid control—without the need to manually log into a separate application and re-key information.

**GETTING STARTED**

OCHIN Epic members are automatically connected to these CMT offerings in states where they are available. Please contact your OCHIN Account Manager for more information.
