CITIZENS FOR SENSIBLE SOLAR
Proposed solar plant development will gut our community. With two massive utility-scale solar power plants being sited under Article 10, we must consider the impacts.

**Future Without Agriculture**
The two Article 10 projects remove significant potential for agricultural production at a time when we are beginning to understand the impacts of climate change and the need for regional food production. We need to become less dependent on California’s Central Valley and identify support resources for regional agriculture.

**Loss of Wildlife Habitat**
Utility-scale solar plants will displace our large deer and coyote populations and force them into more populated areas. Endangered and threatened species, including owls and other raptors will also lose habitat.

**Diminished Community**
The community’s quality of life will be impacted by the loss of open spaces and potential residential growth areas. Property values and tax revenue will decline and the community—including businesses—will suffer a significant economic decline at a time when the housing market is tight and tourism dollars are flowing.

Saving Greene supports responsible solar. Many of us have already invested in solar arrays for our homes, and we all support the need to reduce our carbon footprint. We advocate for responsible solar development projects that are on a scale that doesn’t conflict with the values shared by the residents and visitors to Greene County and the Hudson Valley.
