WHAT IS THE AESMMI-65?

The Adult Epilepsy Self-Management Measurement Instrument (AESMMI) is a 65-item scale that assesses frequency of use of epilepsy self-management practices or behaviors. Each item is rated on a 5-point scale ranging of frequency (i.e., 1=never to 5=always).

Items for the scale were developed from a review of the literature on epilepsy self-management, review by expert panel in epilepsy management and treatment and testing of the instrument with people with epilepsy.

MEASUREMENT AND EVALUATION

10 exploratory domains for epilepsy self-management guided the initial development of the 113-item instrument: treatment, symptom, seizure, lifestyle, wellness, safety, information, communication, social support and stigma management. Items were rated on a 5-point Likert scale ranging from 1 to 5 (i.e., none to all of the time, never to always, not at all to completely true), including a “Not Applicable” option. Total scores are found by reverse-coding 9 negatively worded items and by summing the scores to all 113 individual items. Higher scores for the AESMMI-113 and AESMMI-65 suggest more frequent use of self-management strategies.

The research team field-tested the 113-item instrument among adults with epilepsy, which were recruited from multiple clinical sites and online. The team then conducted reliability and factor analyses using the valid surveys (n=422). Following analyses, the number of items for the instrument was reduced from 113 to 65. The Cronbach’s alpha for the resulting 65-item instrument is 0.935 (Escoffery et al., 2015b).

The factor analysis grouped the 65 items under 11 discrete factors:

- healthcare communication
- treatment management
- coping
- social support
- seizure tracking
- wellness
- seizure response
- safety
- medication adherence
- stress management
- proactivity
