Becoming a global hydrogen hub

September 2020
Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate
   – Entering new H2 markets
   – Converting Houston’s premier system into blue H2
   – Launching green H2 chain developments

Chapter 2: Expand
   – Scale blue H2 to capture export market opportunities
   – Extending green H2 to new markets

Chapter 3: Rollout
   – Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
Pre-2014 oil price collapse, Houston enjoyed advantaged economic growth vs. peer cities and the overall US economy.
Upstream oil and gas has been the primary catalyst for Houston’s growth advantage

Houston Metropolitan Statistical Area (MSA) and US per capita net earnings drivers

35% 35% 30%

US Economic Growth  Upstream Oil & Gas Industry Growth  Infrastructure & Pro-growth Enablers

— Houston economy tracks overall US economy
— Primary generator of high multiplier jobs
— Low housing cost, pro growth policies, low taxes
— Immigration across socio-economic groups

The multiplier effect:
— Economic impacts vary by job type
— Job functions requiring driving inputs from manufacturing, services, construction etc. have higher economic impact

Source(s): Dr. Bill Gilmer from the U of H Institute for Regional Forecasting (model back-tested to 1996)
However, it is unlikely Houston can sustain economic outperformance by relying solely on O&G industry growth.

Houston MSA oil and gas related jobs versus peak quarter

Peak Year: 2014

~80,000 high value jobs lost

Optimistic
Lower for longer
Lower forever

Institute for Regional Forecasting outlooks

Scenario increasingly likely

Note(s): Jobs consist of oil production, oil services, machinery, and fabricated metals – change from SIC to NAICS coding results in classification change
Source(s): US Bureau of Labor Statistics; The Institute for Regional Forecasting
Moving forward, Industry diversification will be required to supplement Houston’s O&G base economy

<table>
<thead>
<tr>
<th>Scenario (Houston GDP growth)</th>
<th>Diversification</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>High risk (lag peer cities)</td>
<td>Limited</td>
<td>Assuming the oil and gas rebound does not occur and Houston MSA does not diversify, economic performance will lag the general economy and peer cities</td>
</tr>
<tr>
<td>Keeping up (match peer cities)</td>
<td>Selective</td>
<td>Limited diversification - arguably the current path - even with continued petrochemicals exports and modest oil and gas recovery, will at best leave the Houston MSA in a parity situation with peer cities and the overall US economy</td>
</tr>
<tr>
<td>Return to outperformance (outpace peer cities)</td>
<td>Significant</td>
<td>Without sustained oil and gas cyclical upside, more significant business diversification will be required to return greater Houston area to prior levels of US and peer city economic outperformance</td>
</tr>
</tbody>
</table>

Sources: US Bureau of Labor Statistics, IMPLAN, KPMG
High multiplier sector diversification options exist where Houston has the rights to win, and lead the Energy Transition

High job multiplier sector diversification options:

- Utility scale renewables
- Plastics and Chemicals manufacturing & recycling
- Carbon sequestration and usage center
- Hydrogen hub
- Data science and technology
- Healthcare manufacturing and R&D

2017 Economical Viability Study

Source(s): US Bureau of Labor Statistics, IMPLAN
Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate
– Entering new H2 markets
– Converting Houston’s premier system into blue H2
– Launching green H2 chain developments

Chapter 2: Expand
– Scale blue H2 to capture export market opportunities
– Extending green H2 to new markets

Chapter 3: Rollout
– Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
Our project sought to develop a customized roadmap to enter and scale clean H2 in greater Houston.

**Project scope & Objectives**

- Summarize how Houston area can leverage its unique assets to enter clean blue and green H2 production

- Identify and prioritize the most advantaged H2 end markets to create new blue and green chains

- Develop a phased roadmap to scale the use of clean H2 and a view/vision of H2 in the Houston energy system

- Identify next steps and key collaborators to operationalize advantaged blue and green H2 chains

**Key contributors**
Key Findings

• **Global decarbonization momentum is growing**, catalyzing substantial **global H2 market expansion of $800 billion** by 2050, as part of **H2 gas plus related technologies market of $2.5 trillion**

• **The Houston area is poised to lead H2’s growth in the energy system**
  – World leading existing H2 system positioned to bring H2 to market, at-scale, quickly
  – Opportunity to create a green H2 industry over time by leveraging significant low cost renewable power and storage synergies

• **There are four immediate initiatives to launch Houston area blue and green H2 market opportunities:**
  – Launch heavy trucking
  – Clean existing H2 system (via CCUS)
  – Exploit seasonal storage
  – Pilot long duration storage

• **Long term, Houston has opportunity to become a local, national, and global flywheel for H2 penetration into heavy industrial markets**

• **Kick starting the H2 economy** and exploiting Houston’s advantages to globalize its leadership in H2, becoming a **global H2 hub**, will require **targeted policy and funding commitments** be made in **short order**

Notes: CCUS refers to carbon capture, usage, and storage
There is snowballing momentum to decarbonize, with hydrogen potentially playing a unique and critical role.
For example, Germany issued a decarbonization strategy featuring electrification, renewables, and hydrogen

<table>
<thead>
<tr>
<th>Guiding principles</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Continue driving electrification of applicable markets, in parallel to accelerating renewable grid penetration</strong></td>
</tr>
<tr>
<td>• Providing clean power to all existing uses, and expanding into adjacent markets (e.g., light transportation and industry, home/building heating)</td>
</tr>
<tr>
<td><strong>2. Prioritize renewable power to displace fossil power over green H2 production</strong></td>
</tr>
<tr>
<td>• GHG impact of fossil power displacement higher priority than producing green H2 due to conversion inefficiencies and substantial power requirements</td>
</tr>
<tr>
<td><strong>3. Accelerate blue H2 to address hard to decarbonize sectors (e.g., steel, refining, H2 chemical feedstock, heavy industry and transport)</strong></td>
</tr>
<tr>
<td>• Blue H2 can be manufactured at scale and cost competitively now, while green H2 is further developed</td>
</tr>
<tr>
<td><strong>4. Find advantaged entry points and build scale in green H2 and wind power</strong></td>
</tr>
<tr>
<td>• Leverage renewable curtailment pricing to support H2 storage, enabling increased renewable grid penetration</td>
</tr>
<tr>
<td>• Develop offshore wind supply chain and synergize with H2 as transmission medium</td>
</tr>
</tbody>
</table>
A general pattern is emerging for progressing the clean H2 economy (grey to blue, expand blue, while nurturing green)

Hydrogen demand and mix over time

Illustrative

-7x volume growth projected ($950B H2 mkt)

Localized Drivers
- Goals: 2050 net zero or similar
- Funding: Carbon fees or other
- Leverageable assets (blue)
  - H2 system
  - At-scale CCUS hub
- Leverageable assets (green)
  - Geologic storage
  - Low power prices

Cross cutting Enablers
- Cost and supply chain improvements
  - Electrolyzers
  - Renewables
- H2 and renewable synergies

Source: Barclays, HSBC, Hydrogen Council
Rotterdam is transforming from a global O&G to hydrogen hub, following this grey to blue to green pattern

From - energy hub of today...

• Refining hub with distillation capacity of 1.2MBOE/D
• European gateway and logistics point, where energy commodities arrive and are distributed
• Global market clearing point (e.g., refined products, bunker fuel)

To - energy hub of tomorrow...

• Clean (blue and green) H2 production hub with integrated system
• H2 gateway and logistics point with Northwest Europe, where 20MMt tons pass through annually
• Trading market for H2 with pricing transparency

Source: Rotterdam Vision
The Houston area holds an anchor position in a world class H2 system, enabling rapid, scale access to new markets

Existing hydrogen system in the Gulf Coast area

TX Gulf Coast H2 system advantages

- Over 900 miles H2 pipelines (56% of US; 32% of global)
- ~3.4MMt of H2 produced annually largely through steam methane reformation (34% of US; 8.5x Rotterdam)
- 48 H2 production plants

World’s largest storage caverns for H2; adjacent to H2 network

** Existing H2 system could leverage in-place CCUS assets (e.g., Denbury pipeline) to readily add and scale CCUS to convert grey to blue H2

Notes: (1) Houston MSA defined Austin, Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery and Waller counties; (2) TX Gulf Coast includes a region from Corpus Christi, TX to Lake Charles, LA; (3) Number of global H2 plants estimated by dividing global H2 production by US avg. production per H2 plant (52k tons H2/year)

Source: H2Tools; USDOT PHMSA - National Pipeline Mapping System; Seeking Alpha; Office of US Energy Efficiency & Renewable Energy; Hydrogen Europe
Additionally, TX has multiple advantages that could improve green H2 economics, supporting a green industry build out.

**Houston wholesale price duration curve, 2019**

- Low cost generation and competitive market structure
- Extensive and growing renewables (#1 wind, #2 solar by ‘25), increasing long-duration storage role

**Average Houston hub wholesale power price, 2019**

- High seasonal price differentials, coupled with low cost storage, enhances storage economics

Notes: (1) variance for high and low prices is calculated based on summer and fall modified off peak hours (11am to 5 pm)
Source: ERCOT, S&P Platts
Potential Houston ‘2050 vision’: local, national, and global flywheel for H2 penetration into heavy industrial markets
A potential customized path for Houston provides a phased approach scale clean hydrogen

Notes: (1) Activate costs assume 50% stretch case investment; (2) 5x stretch case added to investment for expand phase to account for excluded costs (i.e., new blue plants, new green storage applications,); (3) Reduction in CO2 emissions refers to converting trucking to blue H2, buses to green H2, and adding CCUS to existing H2 plants.
Activating the plan to achieve global H2 leadership centers on four immediate initiatives, with targeted policy/funding

**Activate**
- **Launch heavy trucking**
  - Leveraging existing coalitions, assemble group(s) and select / optimize the most attractive market(s) to enter
  - Develop roadmap from activate through rollout

**Clean grey system**
- Assemble coalition
- Develop a prioritized phased plan to couple the high-volume existing H2 system with existing and extended CCUS systems

**Prioritization of blue markets**
- Inject in gas network
- Long haul light and medium duty vehicles (e.g., SUV)
- Industrial process heat

**Exploit seasonal storage**
- Conduction feasibility study (e.g., GTI DOE study) of most cost effective options to leverage Houston’s utility scale, low-cost salt caverns for H2 storage

**Pilot long duration H2 storage**
- PUC to assess H2 storage fit with substantial and growing renewables
- Evaluate funding/policy required to enable maximizing renewable value and ensuring reliability

**Policy and funding**
- Assemble group (e.g., state and federal attorneys, policy makers) to shape potential policy support for TX clean H2 economy
- Develop targeted policy / funding approach, which unleashes new attractive market opportunities, near and longer term
  - Critical to establish market opportunity for H2 and address looming impact of low carbon future on TX economy

Notes: (1) PUC refers to Public Utility Commission
Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate

– Entering new H2 markets
– Converting Houston’s premier system into blue H2
– Launching green H2 chain developments

Chapter 2: Expand

– Scale blue H2 to capture export market opportunities
– Extending green H2 to new markets

Chapter 3: Rollout

– Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
In the activation phase, one priority is to leverage and clean the existing grey system (and the other to initiate green)

Hydrogen demand and mix over time

Illustrative

Grey to blue activation phase

Initial new market expansion for blue H2 in Houston area

A Prioritization of potential new markets for H2...

B ...shows heavy trucking provides priority near term opportunity

Clean existing H2 production

C Integrating CCUS into existing H2 system required to be global leader in clean H2

D Other regions demonstrate scalable CCUS around initial anchor point

E Potentially unique opportunity to activate CCUS at low cost in Houston area
New markets were prioritized based on relative adoption barriers (or advantages) and emissions impacts.

Adoption barriers
- Incremental infrastructure
- Competitive fuel / solution

Emissions impact
- Low
  - Minimal new infrastructure
  - Yet, competes with electrification
  - Inject in gas network

- High
  - Greater new infrastructure
  - Electrification competitive

Initial prioritization of blue H2 markets

- Low
  - H2 competitive vs. diesel
  - Moderate infrastructure

- High
  - Competition with natural gas & off-gas
  - Substantial new infrastructure

“\(\text{We see heavy hauling of freight as kind of like an anchor tenant in the hydrogen shopping mall.}\)"
- Program Lead, Canadian Energy Systems Initiative

Notes: (1) Access to CA Transportation / LCFS via addressed in Expand phase; (2) Seasonal / long duration storage addressed as part of green H2 chain
Sources: S&P Platts
There are several local and regional heavy trucking markets which offer potential demonstration/entry points.

Texas truck traffic, 2018

Houston truck markets: overview and pro’s/con’s of H2 entry

**Truck markets are focused on those involving the Houston area. Assessing viability of H2 trucks in other TX truck markets (e.g., I-35) is out of scope for this study.**

Notes: (1) Number of trucks determined by dividing ton-miles transported between cities by max truck payload
Source: NHTSA.gov commercial mdhd trucks; Interview with Chad Burke from Economic Alliance for Houston Port 16Jul20; Oak Ridge National Lab – FAF Tool; TxDOT
H2 heavy trucking pilots are underway in the LA port area, and studies indicate advantages vs. with diesel and electric

- Consortium of public and private (Port of LA, Shell, Toyota, Kenworth) stakeholders convened to test viability of using hydrogen in heavy duty trucks to reduce emissions in port drayage activities

- Pilot involves 10 HD FCEV trucks and 2 filing stations, costing $82.5M with and funding split between CA and private players

- Lower H2 (SMR) TCO driven by:
  - Low H2 (SMR) cost
  - Increasing diesel costs projected
  - High returns to scale on infrastructure

TCO for diesel vs. low carbon long-haul trucks

![Diagram showing TCO comparison]

Tasks: (1) ICCT study based on LA Port area with 100, 1,000, and 10,000 trucks deployed in 2020, 2025, and 2030; (3) Time and weight penalty applied to BEV trucks; (4) H2 supplied via tube trailer

Source: ICCT
Preliminary indications are H2 is also advantaged locally. Using grey H2 can kick start the market while reducing emissions.

**Phased Market growth for converting diesel to H2**

Chapter 3: Rollout
   – Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
A critical enabler for Houston to lead in the low carbon era is to decarbonize its existing grey H2 system.

**Notes:** (1) H2 emissions based on ratio of CO2 emitted per kg H2 produced; (2) SMR CO2 emissions in 2016, other emissions in 2014; (3) Low/high range based on 55% and 90% CO2 by adding CCUS

**Sources:** US EPA Greenhouse Gas Reporting Program (GHGRP); Environmental Science & Technology; H2tools; US DOE, Denbury, DOE, GRP Capital

---

**Peer cities, annual million metric tons GHG emissions**

- Houston: 165
- New York City: 160
- Chicago: 150
- Los Angeles: 100
- Atlanta: 70

**Mix of Houston MSA annual industrial CO2 emission sources**

- H2 SMR production
- Other industrial emissions

100% = 48 million tons CO2

**Potential annual emissions captured by installing CCUS on H2 plants, Mt CO2**

- Low range (55% capture): 9 Mt CO2
- High range (90% capture): 14 Mt CO2

**Range based on IEA GHG study of CO2 captured at SMR H2 plants**
For example, Rotterdam’s near-term focus is converting its grey H2 to blue through the Porthos offshore CCUS project.
Leveraging existing CCUS infrastructure and prioritizing H2 plants can start Houston on a path to realizing its substantial blue potential

Existing H2 and CCUS systems in TX-Gulf Coast area

Prioritization of H2 plants to add CCUS in Activate phase

- **Approach and rationale**
  - Use phased approach to capture highest Houston industrial emitters, leveraging existing infrastructure
  - Fill Denbury capacity in Activate phase with top priority H2 plants and natural gas fired power plants

- **H2 plants and emissions reduction**
  - Add CCUS to 8 H2 plants with higher capacity and located within 10 miles of Denbury pipeline
  - Lowers H2 emissions by 5.7 Mt CO/year (35% of CO2 resulting from H2 production)

- **Estimated cost**
  - Each H2 plant estimated at $78.5M to add carbon capture and tie-into Denbury (excludes policy support such as 45Q)

Notes: (1) Houston MSA defined Austin, Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery and Waller counties; (2) TX Gulf Coast includes a region from Corpus Christi, TX to Lake Charles, LA; (3) Number of global H2 plants estimated by dividing global H2 production by US avg. production per H2 plant (52k tons H2 / year)

Source: H2Tools; USDOT PHMSA - National Pipeline Mapping System; Seeking Alpha; Office of US Energy Efficiency & Renewable Energy; Hydrogen Europe
Agenda

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
We also examined opportunities to activate green H2.

**Green Activation Phase**

Houston and ERCOT advantages

- **A** Access to low cost power in TX, a key enabler to green H2

TX renewables penetration driving potential need for long duration storage

- **B** Growing TX renewables and tapping further low revenue hrs

- **C** Example: NextEra using green H2 to increase solar asset value

Additional enablers and advantages to promote green H2

- **D** Houston’s unique advantages - salt caverns and seasonal price differentials

- **E** Example: Delta, UT using similar storage advantages as Houston

- **F** Several policy options could further promote green H2
The competitive TX market structure supports green H2 economics via a low cost generation mix and low power prices.

ERCOT electricity generation mix, 2019

- Gas-CC 40%
- Wind 20%
- Coal 20%
- Nuclear 11%
- Gas 7%
- Other <2%

Competitive market structure

- Deregulated energy market
  - Allows customers to choose their supplier
  - Creates retail market competition
- Energy-only wholesale market
  - Generators paid only for energy delivered to market
  - Unique in US as most competitive markets pay generators to provide capacity

Power price by state (cents/kWh)

TX among lowest states for average power prices

Notes: (1) Other consists of solar, hydro and biomass; (2) Average power price refers to 2018 weighted average sales price across retail, commercial, and industrial sectors

Sources: ERCOT, EIA
Additional low price hours are expected with wind and solar growth in TX, creating value synergies with storage

- TX is among top in US in renewable capacity (#1 in wind, projected #2 in solar due to 250% increase over next 5 yrs.)
- Extent of renewables led to 3.1M MWh of wind curtailment in LTM May’20, lowering wind asset revenue
- Significant uptick in projected solar and wind capacity could increase low revenue hours for renewables

Notes: (1) Pipeline refers to planned projects; (2) 2025F assumes pipeline installed by 2025; (3) 2025F penetration assumes linear penetration given capacity/penetration levels from 2022 and 2022F
Sources: Cleantech Group, Rocky Mountain Breakthrough Batteries, Apex Compressed Air Energy Storage, ERCOT, NREL, Lawrence Berkley National Lab
FP&L green H2 production overview

Utilize substantial curtailed renewable power

Power electrolysis plants with low cost renewable power to produce green h2

Blend H2 with natural gas in gas-fired power plant to reduce emissions

**Potential H2 storage mechanism not yet announced**

Project insights

- NextEra has committed to reduce emissions by 100% in 2050
- Led to pilot study to test green H2 feasibility
- Pilot offers mechanism to improve solar asset value
  - Exploit price arbitrage (produce H2 during low demand hours and use H2 during high demand)
  - Offset lower revenue hours
- H2 reduces emissions by replacing portion of natural gas in gas fired power plant
- Plan to request funding approval from Florida Public Service Commission ($65M)

Key stakeholders

**Potential H2 storage mechanism not yet announced**

Sources: S&P Global, Green Tech Media, Clean Technica, Rocky Mountain Institute
Unique scale storage plus high price differentials suggests seasonal storage in the Houston hub be explored

- Houston MSA has three existing utility scale H2 storage facilities developed in salt caverns

- High seasonal price differentials suggest the potential for long duration storage leveraging H2

Notes: (1) variance for high and low prices is calculated based on summer and fall modified off peak hours (11am to 5 pm)
Sources: S&P Platts, NETL

Houston advantage:
Large scale H2 storage caverns

Houston advantage:
High seasonal price differences

Average Houston hub wholesale power price, 2019, $/MWh

- 6.3x variance between high and low price hours
- 3.4x variance concerning high and low price hours

US salt cavern resources
Though greenfield seasonal storage is currently economically challenged in Houston, a path to viability exists.

Annualized margin per MWh for greenfield gas turbine using stored H2 for seasonal price arbitrage, $/MWh$\textsuperscript{1,2}

<table>

DOE grant awarded to GTI to further investigate options to leverage utility scale salt caverns in TX Gulf Coast area
A brownfield project in Delta, UT is underway exploiting similar economic levers

Project insights

- Drive from CA and UT stakeholders for the local power agency to convert existing coal-based power to clean power
- Combination of curtailed renewable power and utility scale salt caverns provide enablers to generate and store H2, which is blended with NG to decarbonize electricity
- Leverages existing coal-plant transmission infrastructure
- H2 piggy backs off of to-be-built gas-fired power plant
- Project costs $1.9B (end to end system) funded by Magnum and Mitsubishi Hitachi Power Systems

Key stakeholders

Notes: (1) Intermountain Power Agency (IPA) provides electricity to Southern CA and other locations in UT; (2) IPA is operated by the LA Power and Water Authority; (3) Application for Department of Energy grant in near future
Source: Mitsubishi Hitachi Power Systems, Forbes, Power Technology, Los Angeles times
Market/policy enhancements in TX could further increase the value of renewables and enhance viability of green H2

### Preliminary options

<table>
<thead>
<tr>
<th>Renewable purchase requirements</th>
<th>Transmission &amp; distribution</th>
<th>Tax policy</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Option</strong>: require power retailers and municipalities to acquire minimum (and escalating) amounts of renewable power</td>
<td><strong>Option</strong>: establish next wave of competitive renewable energy zones (CREZ)</td>
<td><strong>Carbon tax / cap and trade</strong></td>
</tr>
<tr>
<td><strong>Rationale</strong>: Provides incentive for construction of additional capacity to meet acquisition mandates</td>
<td><strong>Rationale</strong>: CREZ was an effective tool for enabling wind transmission development in TX; could further maximize existing and new renewables by capturing low revenue hours</td>
<td><strong>Option</strong>: institute carbon tax / cap and trade system for carbon emissions</td>
</tr>
</tbody>
</table>

#### ERCOT CREZ for wind

- **Option**: extend tax credits for solar and wind development
- **Rationale**: credits have driven uptake and improvements
  - Production Tax Credit for wind expires after 2020
  - Investment Tax Credit for utility solar decreases from 22% to 10% after 2021

Notes: (1) Expiration of tax credits refer to projects that start construction after the year indicated
Sources: ERCOT, energy.gov, Solar Energy Industrial Association (SEIA)
Several next steps are required to leverage Houston’s H2 storage advantages and anticipate TX storage needs

Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate
  – Entering new H2 markets
  – Converting Houston’s premier system into blue H2
  – Launching green H2 chain developments

Chapter 2: Expand
  – Scale blue H2 to capture export market opportunities
  – Extending green H2 to new markets

Chapter 3: Rollout
  – Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
Expand phase H2 focuses on scaling up and exporting blue H2, while fostering green H2 with advantaged market(s)

Hydrogen demand and mix (illustrative)

**Expand phase - blue capital**

Scaling blue H2 production
- Increasing global demand
- Building on Houston’s advantages and expanding blue production

Potential H2 exporter
- Preliminary export markets (e.g., CA for LCFS, Rotterdam)

Coupling TX green H2 advantages with improved electrolyzer economics
- Projected renewables growth, electrolysis improvement, and policy may increase green role
- Opportunity to further decarbonize transit - buses
Global demand for H2 is increasing sharply, and some regions will need to import H2 to meet their demand.

Annual global H2 demand, Mt

By 2050:
- $950 billion hydrogen gas market
- $2.5 trillion hydrogen and support equipment market

Sample of potential markets importing H2

- Net short H2 regional import hub (e.g., Rotterdam)
- US states with potential shortage due to policy drivers (e.g., CA)
- Early market driven adoption (e.g., heavy transportation corridors)

Source: Barclays, HSBC, Hydrogen Council
Houston area structural H2 production and CCUS advantages suggest the potential for a scale cost export role

Case for Houston as global blue export capital

- Opportunity to create low-cost, at-scale CCUS system; 95% clean H2
- Global low cost natural gas feedstock
- World scale in-place H2 production capacity
- Global H2 storage and transport infrastructure leader
- Leading commodity export port
To mitigate core business carbon risk and enable new markets, Alberta installed a scalable CCUS system.

ACTL project insights

- Extensive O&G industry is historic CAN prosperity driver, at risk without carbon mgt. system
- Alberta government facilitated competitive process to reduce emissions; two CCUS projects selected (ACTL, Shell Quest)
- ACTL captures, transports, and utilizes CO2 for EOR
  - Initial CO2 captured totals (1.6 Mt CO/yr) from bitumen refinery and fertilizer plant
  - Potential to scale system 10x to 14.6 Mt CO/yr
- Funding ($1.2B) provided by Alberta government ($495M), CAN government ($63M), and remainder by Enhance Energy
- Potential to integrate blue H2 for attractive markets (e.g., Alberta blue H2 freight truck pilot)

Stakeholder participation

Notes: (1) H2 emissions from SMR, by-product, and other based on ratio of 9, 6.8, and 3.4 kg CO2 for each kg of hydrogen produced via SMR, (2) SMR’s CO2 emissions in 2016 and other GHG emissions in 2014
Sources: US EPA Greenhouse Gas Reporting Program (GHGRP); Environmental Science & Technology; H2tools; US DOE
Two steps are critical for Houston to become a major blue H2 exporter: expand the existing CCUS system and build new blue capacity

**Step 1: Expand existing CCUS system**

Illustrative existing and expanded TX GC CCUS system

- **Capacity**: accommodate (1) converting remaining grey H2 to blue and (2) building new blue ATR/SMR
- **Usage / storage**: utilize for EOR (e.g., Permian) and/or storage in (1) TX Gulf Coast and (2) Extending into Permian
- **Infrastructure**: carbon capture at plants; expanded, integrated CCUS pipeline from CO2 sources to CO2 uses / storage

**Step 2: Build new blue capacity**

Indicative blue H2 production capacity as export capital, Mt H2/yr

- Blue H2 production increases 0.5x - 1x to capture global import demand

**Key considerations**

- **Capacity**: capturing global clean H2 demand requires substantial production
- **Usage / storage**: TX Gulf Coast system is 80-90% utilized based on industrial gas provider interviews, requiring new production
- **Infrastructure**: other global regions (e.g., Rotterdam, Humber UK) have utilized blue ATR to achieve low cost, production at-scale
Initial markets to export blue H2 may include CA for LCFS and/or the I-10 corridor to enable trucking.

Illustrative economics for selling TX produced hydrogen in CA to leverage LCFS

- **Value chains to sell H2 in Houston vs. export to CA**
  - **Produce and sell H2 in Houston**
    - Produce → Transport (local) → Consume
  - **Produce H2 in Houston and ship to CA for LCFS**
    - Produce → Transport → Liquefy → Ship → Consume (CA-LCFS)
  - **Produce H2 in Houston, pipe to CA for LCFS, and enable H2 trucking on I-10 corridor**
    - Produce → Transport (Houston to CA) → Consume (CA-LCFS)

E.g., retrofit natural gas lines and leverage existing H2 lines.

Value from H2 originated in CA

<table>
<thead>
<tr>
<th>Value of Houston H2 + LCFS</th>

Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate
   - Entering new H2 markets
   - Converting Houston’s premier system into blue H2
   - Launching green H2 chain developments

Chapter 2: Expand
   - Scale blue H2 to capture export market opportunities
   - Extending green H2 to new markets

Chapter 3: Rollout
   - Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
Projected renewable penetration, electrolysis improvement, and policy trends could create an expanded role for green H2.

### Key green production drivers in expand phase

1. **TX renewable penetration, %**
   - 2020: 23%
   - 2020F: 34%
   - 2025F: 38%
   - 2050F: 65%

2. **Electrolysis cost and production**
   - Expand phase
   - Unit max production rate
   - Capex cost (USD)

3. **Market enhancements and policy examples**
   - Renewables procurement mandates
   - Renewables tax credit
   - Carbon tax
   - T&D policy

### Implications

1. Growing renewable penetration increases need for long duration storage and reduces power prices
2. Manufacturing at scale will drive cost efficiencies and technology advancements
3. Momentum of market and carbon policy are unknown in US and TX

**Notes:**
- (1) 2025F assumes pipeline installed by 2025;
- (2) 2025F penetration assumes linear penetration given capacity/penetration levels from 2022 and 2022F;
- (3) 2050F represents NREL 2050 base case for TX VRE penetration.

**Source:** Cleantech Group, Rocky Mountain Breakthrough Batteries, Apex Compressed Air Energy Storage, ERCOT, NREL, Lawrence Berkley National Lab, CSIRO
For example, expanded green hydrogen could play a role in progressing heavy transportation decarbonization by fueling transit buses.

Houston metro bus segments: overview and pro’s/con’s of H2 entry

- **Transit: extended cycle**
  - Daily bus count: 200
  - Duty cycle: Extended operations (20hrs/day)
  - Pro’s for entering with H2:
    - Lower emissions than diesel
    - Provides extended range vs. BEV buses
  - Con’s for entering with H2:
    - Overcoming new infrastructure and lack of operational experience

- **Transit: standard cycle**
  - Daily bus count: 580
  - Duty cycle: standard operations (12hrs/day)
  - Pro’s for entering with H2:
    - Lower emissions vs. diesel
  - Con’s for entering with H2:
    - Shorter routes may be more suitable to decarbonize with BEVs

- **Park and ride**
  - Daily bus count: 462
  - Duty cycle: TBD
  - Pro’s for entering with H2:
    - Lower emissions vs. diesel
  - Con’s for entering with H2:
    - Shorter routes may be more suitable to decarbonize with BEVs

Notes: (1) Number of buses for T.E cycle is 25% of total 780. (2) Number of buses for T.S cycle is 75% of total 780

Source: Houston metro
The SunLine transit agency in CA, for instance, has transitioned from diesel to CNG to H2 buses

Project insights

- H2 bus pilots initiated following the Innovated Clean Transit regulation (2018) that requires public transit agencies to be zero emission by 2040

- Three pilots (15 buses, 1 station) have progressed to test the feasibility of routes that operate 20 hours / day

- Pilots funded by US government and CA Climate Investments ($23.8M)

- Pilots were successful, and Sunline plans to shift its CNG fleet to zero emission buses (currently 15 FCEVs and 4 BEVs)

- Fuel for the pilots was a mix of green and blue H2, and the agency has installed an electrolyzer to provide green H2 for future buses
Preliminary analysis shows H2 competitive with diesel in extended run duty, over time

Total Cost of Ownership for diesel vs green (brown power) hydrogen buses ($M/bus)\textsuperscript{1,2,3,4}

Notes: (1) Miles driven per 310/day/bus, 360 days/year; (2) pilot, expand and rollout phases each run 10 years; (3) Base and slower case assume electrolyzer case assumes electrolyzer efficiency and capex cost / unit decrease 79% by 2050 per CSIRO; (4) Base case assumes exponential decrease to CSIRO target, slower case assumes linear decrease.

Source: H2city tool, NREL, FSH JU
Several next steps are required to expand H2 market penetration both locally and for export.

### Critical steps to advance H2

- **CCUS expansion**
  - Convene coalition across CCUS value chain, such as industrial gas providers, midstream/CCUS providers, EOR/E&P and other CO2 users, existing industrial CO2 emitters
  - Confirm prioritization of utilizing existing Denbury CCUS system to support converting grey to blue, develop roadmap for additional phases and extending blue H2 production
  - Conduct detailed planning and costing for ‘Activate’ phase
  - Determine funding and policy support required

- **Blue export markets**
  - Bring together stakeholder coalition across H2 export value chain, such as industrial gas providers, pipeline operators, and energy co’s and shippers with low carbon commitments
  - Conduct scoping economics of export opportunity to CA for LCFS (i.e., leverage pipeline right-of-ways to retrofit/greenfield vs. waterborne shipping)
  - Explore potential Houston to CA H2 pipeline for synergies between I-10 heavy trucking and export to CA for LCFS

- **H2 transit buses**
  - Assemble stakeholder group across the transit bus chain, such as Houston METRO, industrial gas providers, bus manufacturer, and station developer/operators
  - Evaluate and optimize economics for pilot study of H2 buses on extended routes in Houston METRO
  - Identify required and available funding to support pilot study, and potential policy support approaches
Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate
  – Entering new H2 markets
  – Converting Houston’s premier system into blue H2
  – Launching green H2 chain developments

Chapter 2: Expand
  – Scale blue H2 to capture export market opportunities
  – Extending green H2 to new markets

Chapter 3: Rollout
  – Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
The rollout phase for H2 in Houston is uncertain and depends heavily on a variety of forces...

Hydrogen penetration and mix (illustrative)

Rollout phase - H2 economy

Long term forces at play, and potential investment required to enter and scale blue and green H2

A. Forces impact the extent and pace of utilizing clean H2

B. Potential improvements needed to achieve blue and green at-scale

H2’s potential role in decarbonizing Houston’s industrial processes

C. Significant emissions from Houston’s industrial processes

D. Analog projects / regions use of blue H2 to decarbonize their industrial processes

E. Transformation required for blue and green to achieve cost and scale needed for industrial processes

“There is no guaranteed pathway as to how demand and supply for hydrogen will develop, given uncertainty over cost and policy developments...”

- Barcylays
Multiple forces will significantly shape demand, pace, and source of H2 in decarbonization over the long run.

Interrelated Forces that will Shape the Houston H2 Economy

- CCUS technology, economic, and uptake trends
  - Technology advancements to reduce cost burden (e.g., direct air extraction, carbon fibers)
  - Pacing for emitters to adopt CCUS, multiplier effect for production scale economies

- Renewable and electrolysis technology and economic trends
  - Technology advancements to increase efficiencies, reduce cost burden
  - Rate of power cost declines
  - Extent of renewables on grid, further driving benefits of H2 storage

- Public carbon policy and funding
  - Extent of federal and state carbon reduction incentives and taxes
  - Public policy postures toward climate impact

- Decarbonization goals and timing
  - Country/region/state/company net-zero goals
  - Pace to achieve net-zero goals

- Consumer/corporate perspectives
  - Consumer buying behaviors toward low carbon products and companies
  - Employee sentiment toward carbon commitments

- Investor preferences and impact investing
  - Investor pressure/shift to low carbon companies
  - Investment rates in low carbon technologies, accelerating innovation

- Hydrogen end state
Cost and technology advances expected for blue and green, though greater gains required for green to be competitive

**Current Houston blue and green H2 production costs**

- **2019 avg. delivered power price**
- **PEM (38% capacity factor)**
- **PEM (90% capacity factor)**
- **SMR w/CCUS @ $2.78 mmBTU NG**

**Potential improvements for blue**
- Continued improvements in CCUS cost and technology
- Policy instituted to support CCUS adoption
- Retaining low methane cost

**Potential improvements for green**
- Electrolyzer cost and technology materially improve
- Substantial renewables penetration drives ubiquitous low price power
- Policy and investor sentiment favor green H2

Notes: (1) Capacity factor of 38% represents extent of 2019 “low price” hours in Houston
Sources: S&P Platts

**Costs exclude transportation, storage, and dispensing station**
H2 could play a unique role in reducing emissions resulting from Houston’s vast industrial processes.

**TX Gulf Coast vs. US refining and petchem capacity**

- **Remainder of US**: 28%, 72%
- **TX Gulf Coast**: 42%, 58%

**Houston MSA vs. TX industrial emissions**

- **TX**: 40%
- **Houston MSA**: 60%

Notes: (1) Texas Gulf Coast refers to Houston area
Source: EIA, Barclays Research
For example, Rotterdam is leveraging blue H2 at scale and policy enablers to decarbonize its industrial processes.

Rotterdam hydrogen production mix (illustrative)

- Main project driver is to achieve near-term, large-scale CO2 emissions reductions
- Project enables CO2 emissions reductions of 4.3Mt/year, 50% of Rotterdam current refinery sector emissions

</tbody>
</table>

Notes: (1) Emission reductions efficiency refers to the relative avoidance costs (€ t/CO2) among the decarbonization options; (2) Scalability refers to the relative ability to decarbonize industrial processes at scale

Infrastructure investment and pathway for long-term green H2

- **Industrial power**: modify gas power plants to partially utilize H2, and revamp coal plants to use biomass and H2 as feedstock in lieu of coal
- **Industrial process heat**: install new burners and supply systems to fire H2 instead of natural gas, refinery fuel gases, and naphtha gas
- Infrastructure adjustments for H2 today are not bias towards blue H2 and can be leveraged to support future scaled green H2
- Install CCS infrastructure systems at plants and tie-ins to CO2 pipeline system; permanent CO2 storage provided by Porthos project

Source: H-Vision Final Report
Similarly, Humber, UK leverages blue H2 at scale and policy enablers to decarbonize industrial processes.

**Schematic of Humber, UK Industrial Area**

**H2H project insights**
- Project supports UK’s aim to establish a low CO2 industrial cluster by 2030
- Provides mechanism to reduce current CO2 taxes incurred by area operators
- H2 utilized by building new ATR plants with CCUS
- Initially, 900k tons CO2/year reduced by replacing fossil fuels with H2 in industrial processes and power
- Specifics for costs / funding not announced (FID planned for 2023)
- Potential for government funding via the Industrial Strategy Challenge Fund (government fund established to address industrial challenges)

**Key stakeholders**

Source: Equinor, Power Technology, Renewables Now, Financial Post
Advancements across several enablers may open the pathway for blue H2 in decarbonizing Houston’s industrial processes.

**Required enablers to decarbonize industrial processes with blue H2**

<table>

Green H2 may also be an option, as technology/cost advancements lead to ubiquitous low cost renewable power and low cost electrolysis.

Several technology and cost advancements are required:

- Large scale floating wind production
- Offshore, low cost electrolysis
- Salt-water electrolysis
- Long range offshore to shore H2 transmission
- Scale onshore H2 storage and conversion infrastructure
Agenda

Notes: (1) Figures shown in 2020 dollars; (2) Phase costs begin at start of initial year and end prior to start of last year; (3) Costs are discounted at 10% WACC; except CCUS (4) CCUS costs equity financed, 12% cost of equity Sources: H2City Model, EIA, DOE Port Arthur SMR Study, ANL: HDRSAM Model, Gencost
Activating the plan to achieve global H2 leadership centers on four immediate initiatives, with targeted policy/funding

**Activate**

**Launch heavy trucking**
- Leveraging existing coalitions, assemble group(s) and select / optimize the most attractive market(s) to enter
- Develop roadmap from activate through rollout

**Clean grey system**
- Assemble coalition
- Develop a prioritized phased plan to couple the high-volume existing H2 system with existing and extended CCUS systems

Notes: (1) PUC refers to Public Utility Commission

**Exploit seasonal storage**
- Conduct feasibility study (e.g., GTI DOE study) of most cost effective options to leverage Houston’s utility scale, low-cost salt caverns for H2 storage

**Pilot long duration H2 storage**
- PUC to assess H2 storage fit with substantial and growing renewables
- Evaluate funding/policy required to enable maximizing renewable value and ensuring reliability

**Notes**
- Assemble group (e.g., state and federal attorneys, policy makers) to shape potential policy support for TX clean H2 economy
- Develop targeted policy / funding approach, which unleashes new attractive market opportunities, near and longer term
  - Critical to establish market opportunity for H2 and address looming impact of low carbon future on TX economy

**Activate**

**Prioritization of blue markets**
- Inject in gas network
- Heavy duty trucking
- Long haul light and medium duty vehicles (e.g., SUV)
- Industrial process heat

**Existing TX H2 system**

**US salt cavern storage**

**Renewable energy penetration**

**ERCOT (2020)**
- <5 Minutes: spinning and load following
- 5-20 minutes: short-term reserve
- 20 minutes – 2 hours: ramping reserve
- 2 – 12 hours: intraday balancing
- 12 – 24 hours: interday balancing
- Days-months: seasonal balancing

**ERCOT (2022F)**
- Estimated (Operating + planned) (2025F)

**Voltage injection in gas network**
- Heavy duty trucking
- Long haul light and medium duty vehicles (e.g., SUV)
- Industrial process heat
- Heavy utility scale + low-cost salt caverns for H2 storage

**Renewable energy penetration**

- 0% to 100%
- Days-months, seasonal balancing
- 12 – 24 hours, intraday balancing
- 2 – 12 hours, intraday balancing
- 20 minutes – 2 hours, ramping reserve
- 5-20 minutes, short-term reserve
- 0 – 60 minutes, opening and load following

**Adoption barriers**
- Emissions impact
- Low
- High

**Inject in gas network**
- H2 production unit
- H2 storage caverns

**Emissions impact**
- Low
- High

**Gateway to greenhouse gases (GHG) reduction**
- H2 Production Unit
- H2 Storage Caverns

**Ramp up and roll out**
- Jobs creation / economic growth
- Jobs on ramp and scale up
- Jobs on ramp and scale up

**Pilot long duration H2 storage**
- PUC to assess H2 storage fit with substantial and growing renewables
- Evaluate funding/policy required to enable maximizing renewable value and ensuring reliability

**Assemble group (e.g., state and federal attorneys, policy makers) to shape potential policy support for TX clean H2 economy**

**Develop targeted policy / funding approach, which unleashes new attractive market opportunities, near and longer term**

- Critical to establish market opportunity for H2 and address looming impact of low carbon future on TX economy

Thank You!
Agenda

Background: from energy capital to energy transition capital of the world

Executive Summary: the role of hydrogen in the future greater Houston energy system

Chapter 1: Activate
  – Entering new H2 markets
  – Converting Houston’s premier system into blue H2
  – Launching green H2 chain developments

Chapter 2: Expand
  – Scale blue H2 to capture export market opportunities
  – Extending green H2 to new markets

Chapter 3: Rollout
  – Blue and green market upside as trends evolve

Chapter 4: Integrated Greater Houston H2 roadmap and next steps

Appendix
Appendix

- Glossary
- Key H2 market analyses assumptions (trucking, buses, storage)
<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grey hydrogen</td>
<td>Hydrogen produced with natural gas feedstock via either the SMR process or as a by-product</td>
</tr>
<tr>
<td>Blue hydrogen</td>
<td>Grey hydrogen coupled with carbon capture technology to reduce the CO2 emissions (to varying degrees) during H2 production</td>
</tr>
<tr>
<td>Green hydrogen</td>
<td>Hydrogen primarily produced by coupling renewable electricity with electrolysis</td>
</tr>
<tr>
<td>Carbon capture usage and storage (CCUS)</td>
<td>An integrated series of technologies to capture carbon at sources (e.g., H2 production plants), transport the captured CO2 for potential usage (e.g., CO2 for EOR) or storage (e.g., sequestration in depleted oil reservoirs)</td>
</tr>
<tr>
<td>Heavy trucking</td>
<td>Truck duty cycles used to carry freight in long-haul or port drayage applications</td>
</tr>
<tr>
<td>Steam methane reformation</td>
<td>Process utilized to produce hydrogen by combining high pressure steam with methane to produce hydrogen</td>
</tr>
<tr>
<td>Electrolysis</td>
<td>Process utilized to produce hydrogen by using electricity to split water into hydrogen and oxygen</td>
</tr>
<tr>
<td>Seasonal storage</td>
<td>Process of generating and storing hydrogen during low price periods (either seasonally or year-round) and utilizing the stored hydrogen to produce electricity and dispatch onto the grid during seasonal high price periods (e.g., high price summer and fall)</td>
</tr>
<tr>
<td>Long duration storage</td>
<td>Process of storing energy (e.g., hydrogen, battery) for a period of one day or longer and subsequently converting the stored energy into electricity</td>
</tr>
</tbody>
