

Domestic Roof Maintenance CSS

The Problem/Challenge

Safety measures are often perceived as a barrier to completing a task quickly with any job inevitably involving a trade-off between safety and expediency.

The Solution

CSS Worksafe have worked closely with the Health & Safety Executive and Confederation of Aerial Industries to provide a safe system of work at height for aerial and satellite dish installers that maintains the balance between speed and safe practice. Designers can identify difficult access issues on their drawings or with related photographs to indicate suitable safe methods of work that may be appropriate for other activities such as gutter, tile or cement flashing repairs.

Key Points

This safe system of work has been accepted by the HSE as 'Good Practice', and can be adopted by a wide range of tradesmen who work from ladders.

Note :-Ladder restraints, ridge and roof ladders and stand-offs, plus harness attachments , strops and helmets
