

Edge Protection to Risers and Shafts

All shaft openings must be protected with proprietary gate system such as Fullgate.

Installed progressively as cores constructed to prevent any need for fall restraint.

Double guard rails and toeboards to shaft openings are not acceptable. Riser protection must be considered through planning of work to incorporate built in solutions.

Consider reinforcement mesh cast into riser opening and cut out for services progressively.

- Solutions such as GRP grating considered to fill voids.
- Minimum double guard rails and toe boards to all riser openings.
