Objective: To retrospectively look at the utilization of medium-secretion lid functionality after probing. This was for all lids that have an initial diagnosis of non-functional (NF) medium-secretion lid post probing. 13 l (23%) lids were functioning with a VAS of ≤ 1 ≤ 3 post probing. 83% (21/25) of the lids that were functioning post probing were NF lids.

Follow-up studies: Restoring functionality after MAP

Purpose: To retrospectively look at the utilization of medium-secretion lid functionality after probing. This was for all lids that have an initial diagnosis of non-functional (NF) medium-secretion lid post probing. 13 l (23%) lids were functioning with a VAS of ≤ 1 ≤ 3 post probing. 83% (21/25) of the lids that were functioning post probing were NF lids.
