

Illuminated Virtual Windows

A lack of physical space and external light access can restrict where windows or skylights are installed in a property, and so restricts the amount of light within the property. Usually, down lights or ceiling lights can be installed to remedy this, but they can impose on a space and their artificial light can be harsh.

Linear Matrix Australia's illuminated virtual windows provide a soft, natural light and can be installed in recesses of as little as 30mm, or anywhere that you can't fit a window or skylight. The illuminated virtual windows can be installed in a range of properties, including residential, commercial and even industrial.

All units are custom manufactured in sizes from 300 x 300mm to 3000 x 50,000mm, and are energy efficient at any size, with automatic or manual dimming options available. Although they are the only real alternative to natural light, the Illuminated virtual windows can come with interchangeable backgrounds, pure transparent white, solid PMS colours, full colour images or abstract artwork, all digitally printed onto a textile and durable fabric.

Application: Bathrooms, lounges, hallways, bedrooms, residential or commercial application apply.
