Use your colorful pencils or markers to create a 4th of July fireworks show for Max! Color in Max and post your art work along with your Science Saturday photos #WSCFromHome.

Did you know? Fireworks have different colors when they exploded because of the chemicals in them. Different chemicals give off different colored flames when they burn. These chemicals are used to create the different colors for fireworks. Cooper gives off a blue color, while aluminum is white and lithium or strontium gives off a red color.

Remember that fireworks are explosives and are very very dangerous! Let professionals put on the fireworks show while you enjoy the lights and colors from a safe distance.
