

## KG-401F CYANOACRYLATE GLUE

C&T MATRIX is pleased to introduce KG-401F CYANOACRYLATE GLUE to its expanding range of products to meet the growing demands of the die making and converting industries.

KG-401F has been specifically formulated to provide one of the fastest bonds that will hold the positioned product in place. It is the ideal product for securing all types of ejection rubber to die boards within both FLATBED and ROTARY markets.

KG-401F will secure all conventional rubbers, solid or cellular, high performance ejection rubbers and polyurethane based elastomers such as VULKOLLAN and SPRINTCELL. These polyurethane based products have a low energy surface, making them difficult to bond to substrate, the specific formulation of KG-401F has key ingredients to overcome this.

## KG-401F CYANOACRYLATE GLUE

ROTARY die makers will certainly enjoy the benefits of KG-401F, as it will rapidly fix the ejection rubber into position on the curved surface of a die shell.

KG-401F is supplied in EASY SQUEEZE 50g bottles (packed 10 x 50g per box).
