Proper cannabis breeding takes time and patience and an acute attention to detail. It takes a discerning eye and a refined palate. If I don't throw away 90% of my work then I am not doing it right. I have many failures for every success. It is of utmost importance that I am humble and always recognize that as a breeder I am simply a building block in the long evolution of cannabis that started at the dawn of civilization and will continue until long after I am gone. Like science,

the sharing of information is the key to progress. I recognize that I didn't "create" anything, I simply improved upon it. I pledge to work as a team towards a common goal. I pledge to unify and not to divide. I pledge to always breed with a purpose and never let down the people who came before me. I pledge to carry the torch in their names, and I pledge to pass the torch when I am finished.

REGULAR

FEMINIZED

GLUE SNIFFER

Type: Sativa Dominant
Regular Seeds

Lineage: GG4 (F) x GG4 x
The Whip! (M)

Yield: High

Flower Time: 6-8 Weeks

Glue Sniffer is our take on GG4. It's bigger, it's louder, it's more frosty, it's more gassy, and much more hardy. We started by crossing GG4 with a choice male of one of our flagship strains called The Whip! We then spent the next few years selectively breeding the offspring with the original GG4. Each time, we went for more trichomes and more gas. The results are amazing.

Notes From the Head Grower:

This strain will produce record breaking outdoor plants. Multiple reports from the 2018 and 2019 growing season reported some of the largest plants ever grown. She is mold resistant and very hardy in cold climates. If grown outdoors, Glue Sniffer prefers full sun and She is also a stellar choice for indoor growing and typically finishes flowering in 6-7 weeks. For outdoor cultivation she is not an early finisher and is typically harvested the 2nd to 3rd week of Oct. Although her yields can be amazing, Glue Sniffer prefers full sun gardens over partial shade gardens or areas with dense fog and clouds.

Notes from the Breeder:

We spent a lot of time and energy crafting Glue Sniffer. She is an absolute joy to grow and she is an exceptionally good choice to use in your breeding program. If you are looking for vigor, trichomes, and gas this would be our first choice.

#PoweredbyScynce

REGULAR

SFVOG BX5

Type: Indica Dominant
Regular Seeds

Lineage: OG Kush Family

Yield: Average

Flower Time: 9-10 Weeks

Aficionados and growers alike love one of the most renowned cultivars in the OG Kush family, SFVOG. She is pure gas, no fruit, and straight to the head goodness. This strain is easy to grow and adapts well to many different soil conditions, substrates, and climates.

Notes From the Head Grower:

LET HER FINISH! She gains most of her weight and density the last few weeks. Keep her well fed, she likes lots of fertilizer and water. Keep the bottoms cleaned up for best results. SFVOG is a tall and lanky strain and one of the biggest downfalls is her extreme brittleness. Branches must be well secured in order to minimize breakage. Although typically grown indoors, SFVOG is also a great strain to choose in a light deprivation environment. She fills out best in full sun with long summer nights.

Notes from the Breeder:

SFVOG is not an easy strain to use in your breeding program. Stabilizing this strain was particularly difficult for us. The gaseous terpenes found in SFVOG are not a dominant trait and can easily be lost or diminished without very tedious selective breeding. This cultivar was sourced in Humboldt County in 2011. We have selectively backcrossed our SFVOG for five generations (Bx5). We focused on improving the yield and terpene profile. The genetics in our seeds are extremely stable and very little variance will be noticed between plants.

REGULAR

MENDO COOKIES

Type: Hybrid Regular Seeds

Lineage: Mendo Breath (F)
x Glue Sniffer (M)

Yield: High

Flower Time: 8-10 Weeks

Stuck in Mendo is the perfect marriage of two heavy hitting strains. We crossed our infamous Glue Sniffer male with one of our favorite flower production strains, Mendo Breath. The rich, earthy smell of the Mendo Breath coupled with the pungent vapors from the Glue Sniffer make this one a crowd favorite.

Notes From the Head Grower:

Stuck in Mendo tends to finish in about 9 weeks. The yield is far above average. Her height and internodal spacing tend to be slightly above average. She exhibits large elongated colas similar to Mendo Breath. She is not a difficult strain to grow but be sure to give her enough vegetative time to build up solid stalk and root infrastructure. If you do, expect massive yields similar to properly grown Mendo Breath. 2019 outdoor tests proved she truly is "stuck in mendo". Mold resistance is above average, yield is slightly above average and harvest date was Oct 8th.

Notes from the Breeder:

We have always loved growing Mendo Breath and we wanted to see how she would do coupled with one of our frostiest and gassiest favorites. Neither parent seemed to dominate the gene pool. The structure is closer to Mendo Breath but most of the phenotypes tend to have the gassy nose from Glue Sniffer.

REGULAR

DOUBLE DURBAN

Type: Sativa

Lineage: Durban Poison x Orange Durban

Yield: High

Flower Time: 9-10 Weeks

Double Durban is our take on one of the most classic heirloom strains of all time. She emanates a mesmerizing odor of fresh pine, orange zest, fresh squeezed lemons, tamarinds, and mint. The flavor is almost exactly the same as the smell! She is tall and stout but not overly cumbersome like many sativas. The potent smoke is cerebral and uplifting and will leave your mind spinning in circles and motivated.

Notes From the Head Grower:

Double Durban does great in both indoor and outdoor gardens. She is easy to grow and adapts to most environments. She stretches well into flower but nowhere near as much as many other sativas. Her bottom branches reach for the sky and she will form into a bush more than a tree. She tends to hold herself up and doesn't require extensive trellising. Similarly, she takes a little longer to flower than most indicas but not ridiculously long. Outdoors she finishes in late October but the terpenes and trichomes come out strong much earlier. Her mold resistance is far above average which helps with the later finishing dates.

Notes from the Breeder:

We were gifted Orange Durban seeds from a local breeder several years ago. We were astonished with the results and knew immediately we wanted to incorporate such a unique strain into our breeding program. After coincidentally obtaining some heirloom Durban Poison clones from our friends at Humboldt Sacred Roots nursery, we knew we had a match made in heaven. The results have been exactly as planned. All the potency and terpenes from the Durban Poison with the tamed down flower time and harvest date of the Durban Orange. This is a grower friendly Durban selectively bred in the Pacific Northwest for viable outdoor cultivation.

REGULAR

DBKB

Type: Sativa Dominant

Lineage: OgreBerry King Band
x Orange Durban

Yield: High to Extra High

Flower Time: ~10 Weeks

Also known as Durban Berry King Band, this strain represents a harmonious marriage of citrus and fuel, euphoria and sedation, aggressiveness and vigor. DBKB is a perfect hybrid for those who love to grow sativas but smoke indicas. This is an extremely prolific strain that is sure to outgrow almost any space it is provided with. In both indoor and outdoor gardens, plants are teaming with bouquets of large soda-can sized colas.

Notes From the Head Grower:

Ogreberry King Band, the mother to DBKB, was bred by good friends of ours and veteran growers from Happy Day Farms in Mendocino County. It is an insanely aggressive strain descending from Ogre Kush, Strawberry Kush, Royal Kush, and Headband. Once we started experimenting with Orange Durban, another variety we obtained from a local breeder, we noticed striking similarities in the growth pattern and vigor of the two strains and decided to unify the genetics.

Notes from the Breeder:

DBKB can be summed up in a few words: aggressive, hardy, dominant, and potent. This is a fun strain to grow and perfect for hobbyists and professionals alike. She has mold resistant genetics and structure but you still have to be careful because of the sheer massiveness of the buds. She is definitely a stretcher and trellising is usually required. She loves plenty of fertilizer and root space and does great in high heat environments.

A painter doesn't paint with one style of brush and only one color. So, why would you grow with a light that can't adapt to the different cultivars that you are working with?

REGULAR

WHISTLING MOON TRAVELER

TYPE: Sativa Dominant

Lineage: T-Dub x
Durban Orange

Yield: High

Flower Time: 9-10 Weeks

3-2-1 Blast Off! Get ready to take a euphoric trip to the moon and back with a culmination of 2 of our favorite sativas. If you like huge yields, super vigorous plants, and citrusy sativas, this should be your choice. She absolutely reeks of pine, lemon peels, orange zest, and sage. She tastes almost exactly like she smells. The euphoric effects are everything you would expect in a potent sativa. Expect a head spinning, ear ringing buzz that keeps you flying all day while maintaining an acute sense of your surroundings and a clean, fog-free finish.

Notes From the Head Grower:

This is a fabulous choice for both outdoor and indoor cultivation. The plants get MASSIVE in outdoor gardens teaming with awkwardly-huge 2-liter bottle sized flowers. Get out the trellis because her lanky sativa structure will not hold her own weight. This is a fertilizer loving plant so plan on keeping her well fed and give the roots plenty of space. The stretch in indoor gardens is phenomenal so plan accordingly.

Notes from the Breeder:

As soon as we tested the Orange Durban we knew immediately that we needed to cross her with Trainwreck. They have very similar terpene profiles and very similar growth patterns. The Durban is more aggressive but a fairly late outdoor finisher. The T-Dub ripens early outdoors and the flowers are more dense and beautiful.

FEMINIZED

GIRL CRUSH

Type: Indica/Sativa Hybrid (fems)

Lineage: Biscotti x Bad Girl (R)

Yield: Above Average

Flower Time: 7-8 Weeks

Attention gas lovers, this is one categorically sexy lady here! She has beautiful purple hues with thick, sticky frost rails that encase her rock hard flowers. Her dense nugs are exceedingly heavy, yet her strong tall stature does a great job of holding them up. She emanates a mesmerizing aroma of licorice, kerosene, and fennel. Don't be fooled by her good looks and sweet smell, she has exceptionally potent effects that will unquestionably persuade the most seasoned veterans to go straight to bed.

Notes From the Head Grower:

As cultivators, we haven't been this excited about a strain in a while. The test runs we completed were so successful that we are already planning a massive phenohunt to find a winning cut to grow commercially in our facility. There is no doubt that we will find one. All of the tester plants we grew were large, fast growing, stout, and tall. The bud structure is perfect for mold resistance and the leaf to bud ratio is perfect. They fit all the parameters that we require for commercial production. The gas on these ladies is off the charts so be ready!

Notes from the Breeder:

We had a simple purpose in mind when we developed Girl Crush. Our goal was to create the most gassy, kushy, potent strain possible and make it viable for commercial cultivation. We hit the nail on the head with Girl Crush! We used our infamous breeders cut of Bad Girl and reversed her onto one of our favorite gas/fuel/flavor bombs, Biscotti. The phenotypic variation on Girl Crush is amazingly low. Expect almost no variation with subtle differences in height and color.

#PoweredbyScynce

FEMINIZED

HOT MESS

Type: Sativa Dominant
Feminized

Lineage: Glue Sniffer x
T-Dub (R)

Yield: High

Flower Time: 7-8 Weeks

A heavy hitting massive yielding sativa with head spinning euphoric psychoactive effects that seem to never end. Hot mess is oozing with sticky trichomes and emanates a loud aroma of lime zest and mint, like a freshly muddled Mojito. Her perfect lime green flowers take on the appearance of Trainwreck with a sturdier stature and an aggressive yield that exceeds Glue Sniffer. This is an excellent chase for both the outdoor and indoor cultivator.

Notes From the Head Grower:

If you're going for a fast-growing, aggressive, high yielding sativa, hot mess is a great choice. All of the phenotypes in our test runs exhibited similar characteristics. A little bit of trellising is necessary because the plant gets to top heavy towards the end of the cycle but the branches are sturdy enough not to break under their own weight. She has a high metabolism and can handle above average fertilizer and water.

Notes from the Breeder:

Hot Mess is part of our newly launched sativa project. It was an obvious choice as we are striving to develop more productive outdoor sativa varieties. The results from this project came out even better than expected. The phenotypic variation in the strain is extremely low. Appearance of the phenotypes is nearly identical with the major difference between them being the terpene profile. They all tend to lean towards the train wreck, which is normal due to the extremely dominant terpenes in Trainwreck.

FEMINIZED

MADE OF HONOR

Type: Indica Sativa Hybrid
F2 Feminized

Lineage: Sour Snow x
Bad Girl (reversed)

Yield: High

Flower Time: 7-8 Weeks

Currently one of our house favorites, Made of Honor is truly a match made in heaven. Our best and most coveted outdoor varietal finally joined with one of the best indoor and greenhouse varieties. An overabundance of sticky resin oozes from her at an unbelievably early stage in flowering. The terpene rich flowers reek like raspberry danish pastries, with slight vanilla overtones and nose burning, alcohol-like vapor. This is a super potent strain and is not for lightweights!

Notes From the Head Grower:

This strain is super easy to grow, has great mold and pest resistance and will excel in multiple growing environments including outdoor gardens, greenhouses and indoors. She is aggressive and grows almost continuously during the flower cycle. Don't expect to keep her short, if you don't have much headspace she is probably not a good choice for you. Stalks and branches are generally sturdy but will require minimal trellising if you plan to grow huge plants.

Notes from the Breeder:

Sour Snow is a well worked pedigree line that consistently produces amazing offspring. Made of Honor was created using the breeders cut (reversed) of Bad Girl and our breeders cut of Sour Snow (#13). Her phenotypic variation is much below average with most of the offspring resembling Bad Girl in appearance with slightly less purple hues. Expect high 20's to 30's in potency as both Sour Snow and Bad Girl consistently reach those numbers.

FEMINIZED

THE SPICE!

Type: Indica/Sativa

Hybrid Feminize

Lineage: Biscotti x

The Whip! (R)

Yield: Average to

Above Average

Flower Time: 7-8 Weeks

Straight from “The Refinery” at Twenty20, this strain was developed for all you gas lovers out there! The complex terpene profile can only be explained as a melange of pungent spices directly from the kitchen cabinet; Most notably anise, cloves, cinnamon, and nutmeg. This is one of those rare situations where bag appeal, yield, fragrance, and potency all join together in a force to be reckoned with.

Notes From the Head Grower:

A uniform, robust, fast flowering version of biscotti is the best way to explain this strain. Compared to the Biscotti, The Spice ripens a week or two faster, it yields one and a half times more, and it is much more resistant to mold and fungal pathogens. Expect an average amount of stretch and an average amount of required trellising. The strain has proven to do great in greenhouses and indoor and is currently undergoing full term outdoor tests for the 2020 season.

Notes from the Breeder:

Immediately after our first experiments with biscotti, we knew the perfect match for her. Biscotti scores a home run in the terpene category but proved to be lacking in potency, bag appeal and yield. We also found her to be lacking viability in commercial greenhouse cultivation. We experimented by crossing the biscotti with one of our chosen males of the whip. The results were mind-boggling. Super uniform phenotypes with thick oozing trichomes, and nauseating gaseous aromas that fill every corner of every room of a house. The phenotypic variation on this strain is about as low as we have ever seen before.

FEMINIZED

MMXX

Type: Indica/Sativa

Hybrid (fems)

Lineage: Sour Snow x

The Whip! (R)

Yield: Above Average

Flower Time: 7-9 Weeks

MMXX, our namesake strain is the culmination of decades of careful and selective breeding and is the embodiment of our brand itself. MMXX has enormous colas and mind-blowing potency, she is exploding with irritatingly sticky trichomes. The earthy fuel and spicy dank terpenes reminiscent of the misty mountains she was born in, comes through in both aroma and flavor. This is true California, true Emerald Triangle and true Twenty20.

Notes From the Head Grower:

The MMXX is a high yielding, easy to grow strain that is well suited for both indoor and outdoor cultivation. She is fast-ripening and tends to finish early in outdoor gardens.

The top colas can become unruly and massive so it is advised to have more than one top per plant. Indoors, the stretch is average with little trellising required although the large buds may need to be supported. Just like the Sour Snow, she does better in large pots with ample room for the roots. Grown outdoors in large pots or beds, the plants can get massive and produce amazing yields.

Notes from the Breeder:

This isn't the first time we've crossed Sour Snow with The Whip! but it is the first time we have released this strain to the public. The Sour Snow is a sativa dominant, ultra-stabilized pedigree breeder descending from Humboldt Snow and Sour Diesel. She is mold resistant, early-ripening and reliably potent. The Whip! is an ultra potent, high yielding, early ripening indica dominant cultivar descending from a long line of Afghanis locally referred to as Strawberry Afghan or Strawberry Kush. She was selectively bred by veteran breeders for decades in the hills of Humboldt County.

FEMINIZED

T-DUB (TWENTY20 TRAINWRECK)

Type: Sativa Feminized Seeds

Lineage: Heirloom

(Exact lineage unknown)

Yield: High

Flower Time: 6-8 Weeks

This is our version of Trainwreck, an absolute classic Northern CA heirloom variety. She has endured through the decades and has garnered a loyal group of cult-like followers. Her buds reek of crushed pine needles, lemon zest and fresh ground black pepper. The stimulating, uplifting effects are nothing short of inspirational.

Notes From the Head Grower:

Here at Twenty20 we have a strong affinity towards Trainwreck. We have been growing her since the mid-90's with nothing but positive results. She is one of the easiest strains to grow and does great in both the outdoor and the indoor garden. She ripens quickly and is typically harvested in early October. Indoors, her yields are huge with minimal vegetative time required, she is ripe in 7-8 weeks. Her tall vine-like structure requires trellis but the efforts are rewarded with a plethora of dense golf ball sized nugs. This is a great choice for any gardener from beginner to professional.

Notes from the Breeder:

Trainwreck is a distant ancestor of many modern strains. She was extremely prolific in the 90's and early 2000's when many of today's breeders were just beginning to experiment with hybridization. Trainwreck is the very first strain we here at Twenty20 ever bred with. T-Dub is a product of those early experiments. It is very similar in look and smell to the original Arcata Trainwreck but the yield is slightly improved, the trichomes are thicker and the smell is a bit more pungent and spicy.

SPECIAL NOTE REGARDING T-Dub vs Arcata Trainwreck

The question comes up quite often about the difference between our two versions of trainwreck. There are a few minor differences between the two. T-Dub is a bit more stretched with more internodal spacing and larger flowers. The smell is a little more pungent on the T-Dub.

FEMINIZED

TRAINWRECK (ARCATA)

Type: Sativa Feminized Seeds

Lineage: T-Dub (Twenty20 Trainwreck) x Trainwreck (Arcata Cut)

Yield: High

Flower Time: 6-8 Weeks

Arcata Trainwreck is deservedly one of the most celebrated and renowned strains from the Emerald Triangle. The unknown origins of this mythical strain are shrouded in tales of fantasy which add to the mystique of this exotic strain. She emanates a truly unique fragrance of pine needles, cat piss, lemon grass and black pepper. The effects are potent yet inspirational and cerebral. This is a true heavy hitter in the garden and famously does great in a variety of climates.

Notes From the Head Grower:

Trainwreck is every cultivator's dream flower. This strain was famously grown outdoors in the Emerald Triangle for decades. When indoor cultivation became common in the 90's she was moved inside and proved to do just as well. Trainwreck is renowned for it's mold and powdery mildew resistance. Her yield is staggering. She adapts well and can be grown by practically anybody anywhere. This is not a stacking variety. Expect hundreds and hundreds of nice tight almost pre-manicured buds. She usually requires some type of trellising so be prepared to give her the support she needs. Harvest date can be as early as late Sept but is typically harvested the first week of October.

Notes from the Breeder:

Here at Twenty20 we cut our teeth growing Trainwreck. This strain has been a part of our breeding program for over two decades. We spent years developing T-Dub and when we finally got our hands on some original cuts of Arcata Trainwreck we knew we had to bring her back to her roots. She is an excellent breeder and excels when paired with a strong heirloom Indica. Trainwreck has extremely strong traits that tend to dominate the gene pool.

The Arcata Trainwreck finishes slightly sooner and exhibits slightly better mold resistance. It will require more trellis support as well. They are both excellent choices for your indoor AND outdoor gardens.

REGULAR

FEMINIZED

BAD GIRL

Type: Indica Dominant
Regular Seeds

Lineage: GSC (F) x
The Whip! Bx4 (M)

Yield: High

Flower Time: 7-9 Weeks

Bad Girl is the perfect marriage between a heavy hitting kush and the classic GSC. She carries an extremely deep, rich, earthy kush flavor reminiscent of Master Kush but also reeks of jet fuel and mentholatum. She's a photogenic beauty and usually steals all of the attention in the garden.

Notes From the Head Grower:

Bad Girl has quickly become one of our favorites in the garden. Compared to most other GSC related strains, her yield is exceptional. She is tall and stout and doesn't have any obvious negative sensitivities to nutrients. She stretches well into flower and typically has usable flowers from the bottom nodes all the way to the top!

Notes from the Breeder:

Bad Girl is the love child of some of our favorite strains. Her father was a 4th generation backcross (Bx) of The Whip! The Whip! Is a cross of Island Mt Strawberry Kush and Sour Snow. Her Mother is an absolute phenomenal cut of GSC we obtained from our good friends and veteran breeders at HumboldtDNA.

#PoweredbyScynce

FEMINIZED

***Limited Quantities**

PRE-98 BUBBA

Type: Indica Dominant
Feminized Seeds

Lineage: Heirloom
(Exact Lineage Unknown)

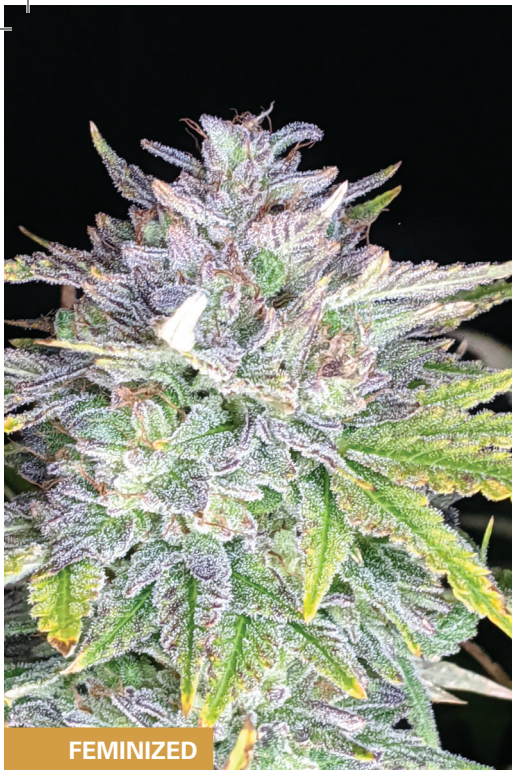

Yield: High

Flower Time: 8-9 Weeks

A tried and true classic, Pre-98 Bubba truly lives up to all the hype. A timeless strain, She has transcended through decades and rightfully earned the love and affection of her cult-like followers.

Notes From the Head Grower:

Pre-98 Bubba is a relatively simple strain to grow. Her post vegetative stretch is average to above average. She has a uniform flower structure with dense, trichome oozing flowers that don't get overly large and moldy like some other phenotypes of Bubba. Under certain conditions she has slight purple tendencies but just enough to paint the leaf tips and calyxes. The yield and flower time is average and on par with most other kush's in the same family.

FEMINIZED

AVENUE OF THE GIANTS (F2)

Type: Indica Dominant Hybrid (fems)

Lineage: Ave #33 x Ave #12 (F2)

Great Success x (Testarossa x Sour Strawberry)

Yield: Average

Flower Time: 8 Weeks

Named after the famed highway in Humboldt County that meanders through the majestic redwood trees through the dankest of earthy forests, Avenue of the Giants is a union of epic proportions. A culmination of decades of cannabis heritage and cultivation prowess, this strain was developed with terpenes on our mind. This is the confluence of three of our all-time favorite terpene rich strains bred in different regions of the Emerald Triangle by some of the most respected farmers and breeders. The aroma and flavor are dominated by rotten grapes, mushy strawberries, sassafras and red cedar. Although initially the terms gas and fuel come to mind, that terminology doesn't do this strain justice. Gas and fuel fumes are more subtle, The aroma of Ave of the Giants causes an ammonia like deep sinus burn. The effects of smoking are nearly instantaneous with a cerebral confusion followed by a seemingly endless head spinning high. This is an excellent strain for outdoor cultivation because of its earlier than normal finish time. If you are looking for elite contest quality terpenes and flavor, this is your ticket.

Notes From the Head Grower:

Avenue Of the Giants has proven to be a great choice for indoor and outdoor cultivation. She descends from a mostly indica line of proven outdoor cultivars. Full term outdoor season trials verify that she is on par with an early October harvest and seems to exhibit stronger than average resistance to botrytis and powdery mildew. Although the plants can get huge outdoors, expect minimal trellising and average to below average stretch for indoor cultivation.

Notes from the Breeder:

These are stabilized F2's that were created using the winners of a huge phenohunt of F1's. It started with a random stop at a gas station where we happened to see our friend Leo, the founder of Aficionado Seeds. We traded a couple of handfuls of seeds and ended up with a baggie of seeds of a strain that later became known as Testarossa. We crossed those seeds with two heavy terpene and super early outdoor strains, Sour Strawberry and then added the infamous terpene bomb, Great Success to the mix!
