Food Fortification Initiative (FFI) champions effective grain fortification so people have the nutrition they need to be smarter, stronger, and healthier.

**HOW WE WORK**

We help country leaders **plan, implement, and monitor** sustainable, country-led fortification programs. The only global group that focuses exclusively on the world’s most commonly consumed grains—industrially milled **wheat flour**, **maize flour**, and **rice**—our data-driven approach effectuates large-scale change by engaging public, private, and civic stakeholders. FFI is also the only organization that tracks country and global progress in grain fortification. Established in 2002, FFI is based at Emory University’s Rollins School of Public Health.

**WHY WE WORK**

Over 2 billion people lack the essential vitamins and minerals, or micronutrients, needed to live a healthy and productive life. Micronutrient deficiencies stunt growth and learning, weaken immune systems, and disproportionately affect the world’s most vulnerable women and children. Fortifying foods with micronutrients like iron and folic acid is a proven, cost-effective strategy to prevent micronutrient deficiencies and their severe health consequences.

1. **1.2 billion** women of childbearing age have at least one micronutrient deficiency

   These women face a greater risk for maternal death, anemia, and other health consequences. Anemia is often caused by deficiencies of micronutrients including iron and zinc. Pregnant women with severe anemia are twice as likely to die during or shortly after pregnancy than non-anemic women.

2. **220,000** babies are born with a folic acid-preventable NTD each year

   Birth defects of the brain and spine called neural tube defects (NTDs) can be debilitating and often fatal. Women who regularly consume foods fortified with folic acid are less likely to have an infant with a birth defect of the brain and spine.

3. **372 million** preschool-aged children have at least one micronutrient deficiency

   Micronutrient deficiencies during childhood, and particularly during early childhood, can have lasting harmful health effects such as stunted cognitive and physical development, permanent blindness, and a weakened immune system. Each year, at least 1 million children die as a result of health effects linked to micronutrient deficiencies.
**FORTIFICATION FOR IMPACT**

Reducing micronutrient deficiencies improves a country’s economic productivity, reduces healthcare expenditures, and builds food security. Furthermore, fortification can restore to diets the nutrients lost in crops as a result of climate change. FFI’s work addresses United Nations Sustainable Development Goals 1-5, 8, 10, 11, and 17.

**THE OPPORTUNITY**

According to FFI estimates, only 20% of industrially milled cereal grain was fortified in 2022. This gap represents a tremendous opportunity for fortification to improve the lives of millions.

Top economists have declared fortification to be one of the most cost-effective development investments that exist today; for every $1 USD spent on fortification, there is a $27 USD return. And, when implemented and monitored well, fortification has the power to make large-scale impact on lives. An estimated 23% of folic acid-preventable spina bifida and anencephaly, 61,677 NTDs, were prevented globally in 2020—an average of 169 a day—in countries where flour was fortified with folic acid.²

**WHERE WE WORK**

Reducing micronutrient deficiencies improves a country’s economic productivity, reduces healthcare expenditures, and builds food security. Furthermore, fortification can restore to diets the nutrients lost in crops as a result of climate change. FFI’s work addresses United Nations Sustainable Development Goals 1-5, 8, 10, 11, and 17.

FFI supported 33 countries 2022-2023, working to reach nearly 1.4 billion people—many of whom are the world’s most vulnerable to micronutrient deficiencies.

**HOW TO READ THE MAP**

Potential Reach (in millions of people)

- Industry-Milled Grain
- FII in Action
- Plan
- Implement
- Monitor

FFI supported 33 countries 2022-2023, working to reach nearly 1.4 billion people—many of whom are the world’s most vulnerable to micronutrient deficiencies.
