Re: Light replacement with LED bulb and base

To replace light base with new style LED light and base first turn off the refrigerator power

Remove large base from Fridge wall by removing screws

Pry at end of the bulb with flat blade driver to remove light bulb from base.

Unscrew old base, save screws

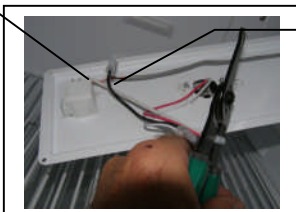

With power off cut two wires near plug, then strip insulation off wires 1/2 inch (7mm)

Screw new base to large base and feed new LED wires through hole. Push bulb into base.

Red wire from light to wire from switch.

White wire from light to the other wire that does not go to the switch

Red wire from light connects to wire from switch, white wire from light connects to black wire

Replace screws in base

In some applications a cover plate may be required to cover existing hole
