

# Service Memo

**To:** Service Personnel

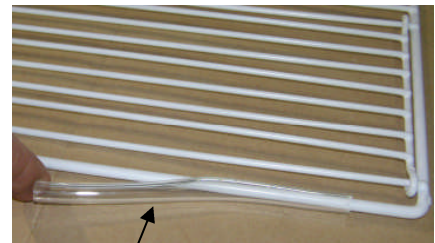

**Re:** RFU 90 shelf restraints

---

**Problem:** Shelf moves forward away from wall while underway.

**Cause:** Shelf is a loose fit on cabinet supports

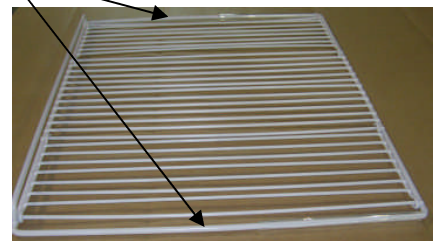

**Solution:** Install shelf friction tube on each outer wire on shelf. This will tighten the shelf against the wall of the fridge and minimize movement while still being able to remove the shelf to clean and reposition.

Slide split tube over the outer edge wire of shelf on both sides.

Position near back of shelf  
Push shelf into cabinet on desired level

To tighten fit stretch outer wires by pulling shelf apart to make a little wider
