ReScape California is a non-profit organization that educates about and advocates for a whole-systems approach to landscaping that works in harmony with the natural world and addresses the changing environment. ReScape’s landscaping practices are based on 8 regenerative principles which foster soil health, sequester carbon, conserve water and protect habitat and valuable resources while reducing waste and preventing pollution in our communities and watersheds.

**Sacramento River Watershed**

A watershed is all the land in a region from which rain collects and drains into a common creek, river, lake or bay. The water in a watershed moves across the land and through the storm drain system both underground and on the surface. Water that flows onto streets and into gutters is called urban runoff. On the way to the creeks and rivers, urban runoff picks up pollutants that eventually end up, untreated, in our waterways.

The 27,000 square-mile Sacramento River Watershed drains the Sacramento Valley, the Modoc Plateau, and parts of the Cascade Range and Sierra Nevada Range. This watershed is one of the largest in the United States and covers most of northern California. The Sacramento River carries 31% of the state’s total surface water runoff. The mouth of the Sacramento River is at Suisun Bay near Antioch where it combines with the San Joaquin River, flows into the San Francisco Bay and ultimately meets the Pacific Ocean under the Golden Gate Bridge.

Whether your landscape is next to a creek or miles away, your activities impact the quality of water in the Sacramento River Basin. In healthy landscapes, water from rain or irrigation percolates through soil that is rich in organic matter and alive with organisms. Living soils absorb and retain much of the water while also filtering out pollutants before the water reaches the aquifer or watershed. Incorporating ReScape’s 8 Principles into your landscaping practices will ensure that you are helping to protect the watershed and minimize pollutants that reach the waterways where we live, work and play.
8 Landscape Principles

1. Act Local
   Built landscapes are a part of the larger ecosystem of the Sacramento Watershed and they can contribute to its health if designed and maintained using sustainable practices.

2. Reduce Waste
   Reduce waste by choosing the right plants, avoiding invasive plant species, using recycled and salvaged products in the landscape, and by composting, mulching and grasscycling plant debris.

3. Nurture Soil
   Soils are living ecosystems and when landscape practices allow the soil food web to thrive it can filter pollution, store water, provide plant nutrients and help plants resist pests naturally.

4. Sequester Carbon
   Healthy vegetation works together with soil rich in organic matter and beneficial microorganisms to remove carbon dioxide from the air and store it as soil carbon, an important strategy for addressing climate change.

5. Save Water
   Creating drought resistant soils, select plants naturally adapted to summer-dry climates, use stormwater, greywater and recycled water in the landscape as much as possible, and use efficient irrigation systems that include self-adjusting, weather-based controllers.

6. Conserve Energy
   Reduce the need for mowing and shearing, shade buildings and paved areas, use efficient outdoor lighting, and buy local landscape products.

7. Protect Water & Air
   Maximize permeable surfaces and minimize stormwater runoff, use integrated pest management, minimize the use of synthetic pesticides and avoid overuse of fertilizers, reduce fossil fuel consumption, and plant trees to remove CO2 and absorb air pollutants.

8. Create Habitat
   By using native plants and increasing the diversity of plant palettes, our built landscape can provide food, water and shelter for birds, butterflies, beneficial insects and other welcome creatures.

Reduce Waste

Our Reduce Waste principle reduces waste by choosing the right plants, avoiding invasive plant species, using recycled and salvaged products, and by composting, mulching and grasscycling. Landscapes designed and maintained with waste prevention in mind help reduce the tons of plant debris generated annually as well as the amount of embodied energy consumed by our landscapes.

Simple steps to Reduce Waste

1. Select appropriate plants. Choose plants that can grow to their natural size in the allotted space to reduce the need for pruning. Replace sheared hedges with natural shaped hedges. Avoid invasive species.
2. Keep plant debris on-site by composting, mulching and grasscycling. Reusing plant trimmings improves soils, helps conserve water and keeps organic matter out of our landfills.
3. Prune selectively and properly. Pruning should complement the natural form and strengthen the structural integrity of the plant.
4. Water carefully to prevent rampant growth that weakens plants and generates unnecessary plant debris. Make certain water is going where it is intended; watering hardscapes and fences should be avoided.
5. Use salvaged items and recycled content materials in your hardscapes and raised beds or simply to add an interesting design element.

Reducing waste protects our watershed

- Composting and mulching reduces fossil fuel consumption from hauling and processing plant debris off-site.
- Selecting plants that will thrive without unnecessary chemical inputs that contaminate the watershed reduces urban runoff and improper disposal.
- Avoiding invasive plants eliminates their inadvertent spread along creeks and rivers where they will need to be removed and disposed of.
