-  38 - 42
-  43 - 47
-  48 - 52

Numeric values above represent progressively increasing relative (watershed by watershed comparison) susceptibility of Values-at-Risk to Post-Fire Hazards. The values shown represent the average of several VAR and hazard intersections for Water Infrastructure, each calculated on a per HUC12 basis. Basins with no estimated risk are shown as blank/empty. The maximum possible value of 100 would represent the highest presence of Values-at-Risk and the highest likelihood of Post-Fire Hazard occurrence.

 Provides a watershed-by-watershed assessment of total post-fire risk against Water Infrastructure Values-at-Risk (VARs).

* HUCs are described at: <https://water.usgs.gov/GIS/huc.html>
