

Quickstart Guide

For Maya users

Welcome

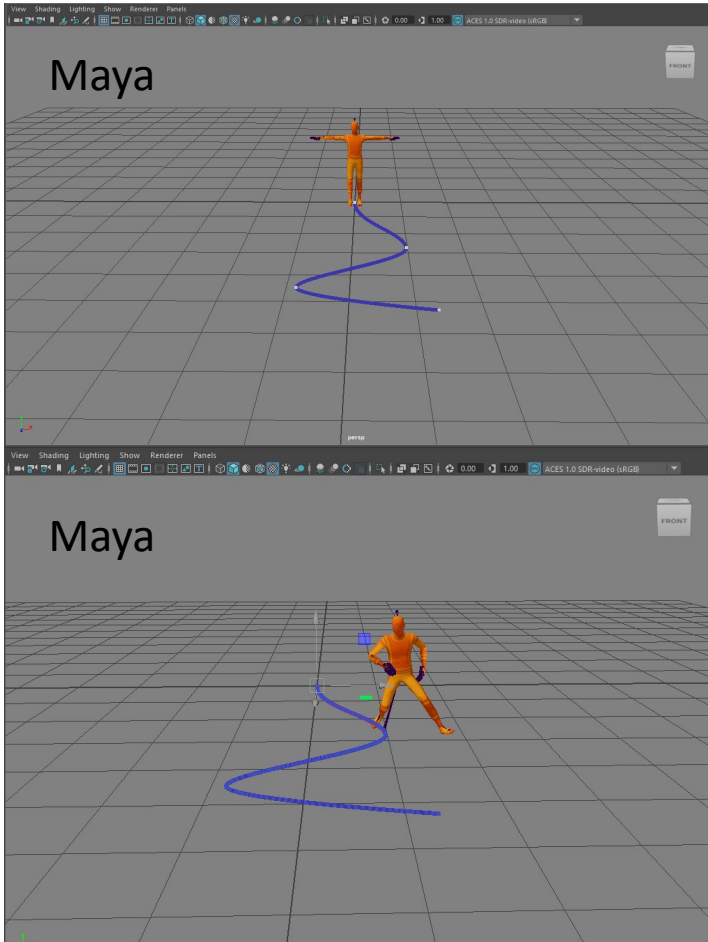

Welcome to Motorica MoGen, the ultimate tool for creating seamless locomotion in games, cinematics, VFX, and the Metaverse! Say goodbye to tedious animation work, and hello to effortless motion generation. With MoGen, you can easily configure preset root motion, mix styles, and hit "GENERATE" to bring your hero characters, NPCs, or crowds to life. Our team at Motorica is dedicated to developing cutting-edge technologies for advanced character animation, using generative deep learning to push the boundaries of what's possible. This guide will walk you through our pipeline for Autodesk Maya usage, but be sure to check out our guides for stand-alone and Blender for other pipelines. Get ready to start creating amazing motion with MoGen - happy generating!

- the Motorica team

3-step pipeline

1

Keyframe root motion in Maya and export as fbx

Import the generated fbx back to Maya

2

Upload fbx to Motorica and generate animation. Export fbx.

3

1

Keyframing in Maya

1. Download the [Motorica character fbx](#) and import it to Maya.
2. Select the "RootBone" node

3. Keyframe the RootBone so the character slides in a T-pose along the ground. Motorica supports a **maximum of 20s** animations. Note: Here we added an "editable motion trail" to visualize the character path

4. With RootBone selected, choose File->Export Selection and export as fbx. Make sure the "Include->Animation" is checked. The fbx now contains animation curves and can be uploaded to Motorica web.

5. Go to www.motorica.ai/mogen

MoGen web – overview

The image shows a screenshot of the MoGen web interface. The main area is a 3D viewer with a character running. On the right is a control panel with various settings. At the bottom is a playback control bar. Annotations with arrows point to specific features:

- visualization options (does not affect generation)**: Points to the top right of the 3D viewer.
- Dropdown menu to logout or report issues**: Points to the user profile icon in the top right.
- Generate new animation**: Points to the 'Generate Animation' button.
- Randomize (new seed + generate)**: Points to the dice icon.
- Seed history**: Points to the seed input field.
- Switch between Motion and Styles panels**: Points to the 'Motion' and 'Styles' tabs.
- generation settings**: Points to the 'Style Library' section.
- play / pause**: Points to the play button in the playback bar.
- scrubbing bar**: Points to the progress bar in the playback bar.
- loop playback speed**: Points to the '1.0x' speed selector.
- loop**: Points to the loop icon.
- run-in-place**: Points to the camera icon.
- move camera to follow character**: Points to the character icon.

How to synthesize

#1 - Define motion
Option 1 Upload FBX file and import root motion
Option 2 User motion presets

#3 - Choose loopable
Select to generate a loopable animation

#4 - Generate
Click to generate animation
Hit  to change seed and generate another variant of the motion. Use seed history to go back to previous ones.

#2 - Enter style(s)
Choose one or combine two styles

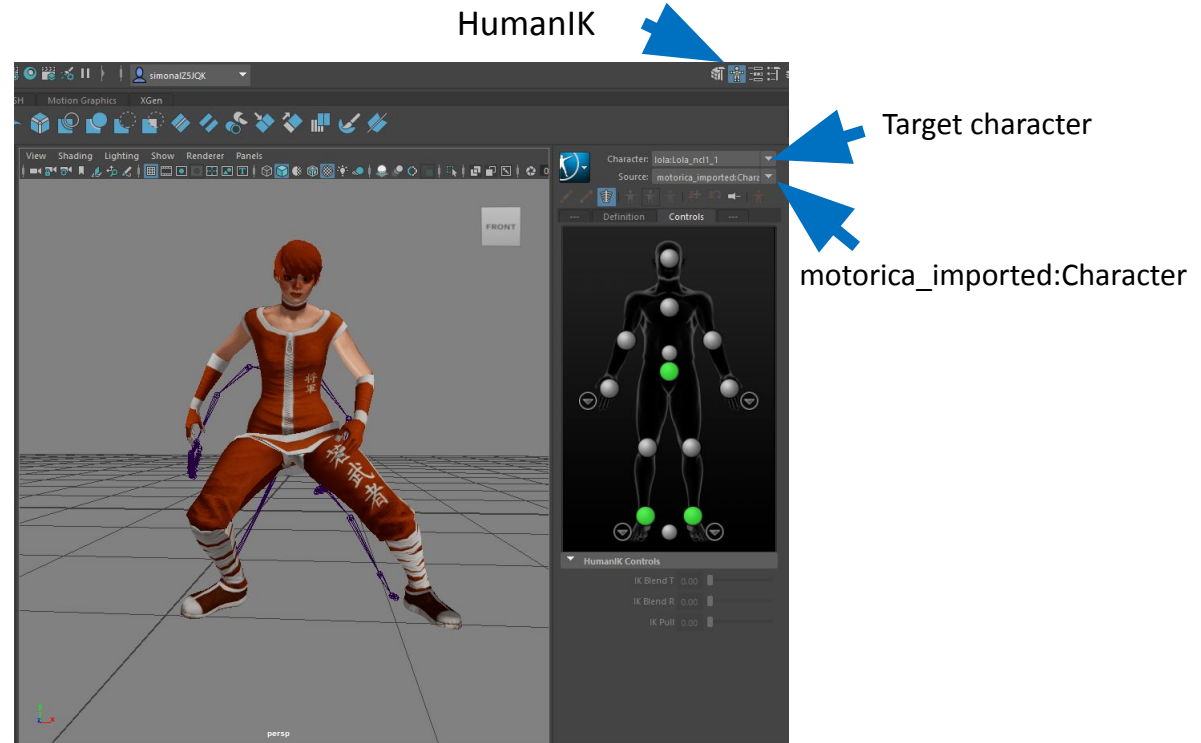

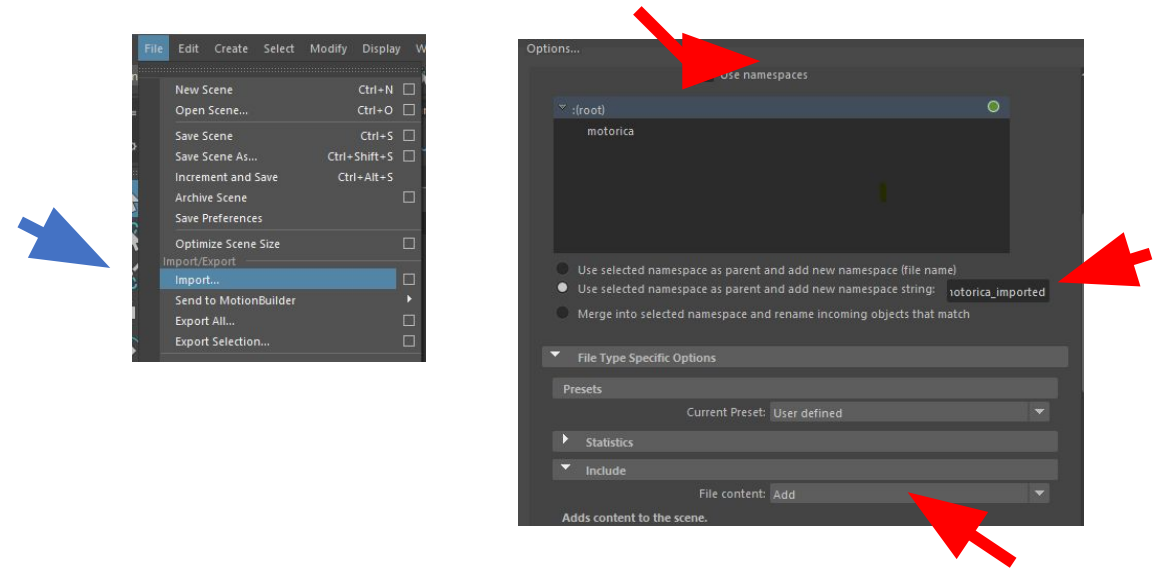

3

Import and retarget in Maya

1. Import the generated fbx to Maya using "File->Import..."
2. In the import settings, import the animations to a separate namespace, e.g. "motorica_imported". This will add the animated skeleton to the scene.

3. Retarget to your desired character using HumanIK. This is easy as the imported character is already characterized. Follow the Maya-guides on retargeting to transfer the animation to your target character.

Tips-and-tricks

- Avoid style mixing in the beginning as it is hard to see what happens. Explore one style at a time until you are familiar with how they look.
- Some styles have limited running capabilities, which is somewhat tied to the style. It is for example very unusual in real life to see people running while texting, or old people sprinting in athlete pace. Use the controls wisely and do not expect too much of strange combinations.
- Some root motion speeds can be equally valid for a slow jog as for a fast walk. Hitting randomize several times may give you the motion you want.
- Some styles, e.g. Zombie, look better walking more sideways than straight ahead. This will generate limping as for a leg injury. Motorica uses the orientation of the hips to define what is forward. Experimenting with the local rotation may generate interesting variations.

Advanced use

If your target character is different in size than the motorica character and you need exact control over the final character positions after retargeting, do the following.

1. Add a transform named "scale" as a parent to the Motorica RootBone and scale it so the Motorica character's hip-bone aligned with the target's.
2. Keyframe the RootBone as before.
3. **IMPORTANT:** export with the scale-transform selected.
4. Import and retarget animations as before. The retargeted motion should now match your target character.

Added scale transform named "scale"

Thank you!
