Impact of generative AI on skills in the workplace

December 2023

Research by Mandala Partners in
partnership with the Future Skills
Organisation

Occupations with more **cognitive** and less physical skills, that have **higher required skill levels** are more likely to be impacted as generative AI systems are implemented.

The **primary impact on the training system** will be at the **university level** as occupations that generally require university qualifications typically have greater exposure to generative AI.

Within the **Vocational Education and Training (VET) system**, **higher level qualifications** are more likely to face disruption.

Of the three training packages within finance, technology and business, the **greatest exposure to GAI** was faced in the **Financial Services and Business Services training packages** followed by **ICT**. This is due to the presence of some occupations in ICT which require a combination of more physical skills with cognitive skills. However, the exposure in many qualifications in the ICT training package was still found to be above average.

In the **Financial Services training package**, the greatest exposure to generative AI is in qualifications preparing people for roles in **accounting and clerking** for financial services firms.

In the **Business Services training package**, the greatest exposure is seen in **administration and call centre** roles.

In the **ICT training package**, the greatest exposure is seen in **software development and programming** roles.

THE OCCUPATIONS WITH THE HIGHEST REQUIRED SKILL LEVEL ARE MORE LIKELY TO CHANGE AS GENERATIVE AI SYSTEMS ARE IMPLEMENTED.

Higher level qualifications are more likely to be disrupted by generative AI

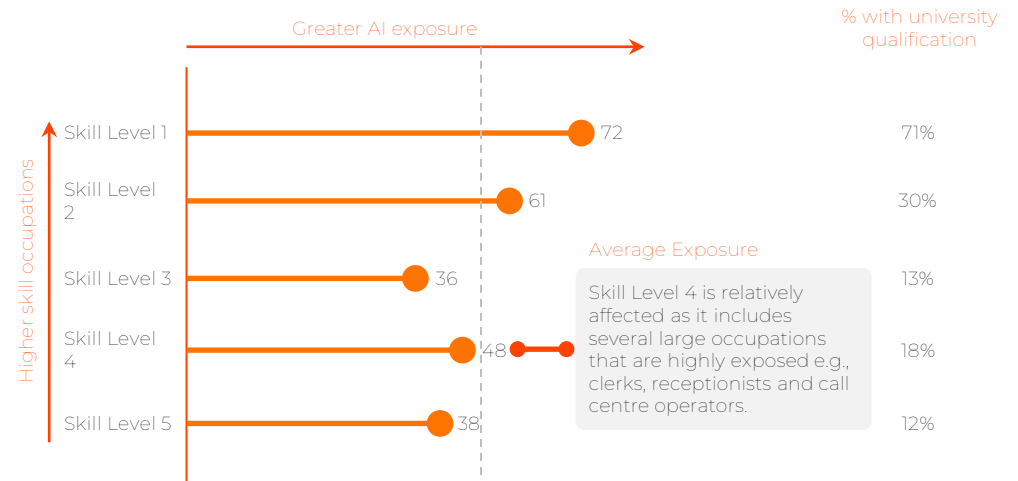

When applied to Australian occupations, occupations in skill level 1 and 2 were the most exposed to AI. Occupations in skill level 1 are those that require tertiary education while skill level 2 occupations typically require a diploma. These occupations tend to rely more heavily on cognitive skills which AI excels in. This means that qualifications from universities face the greatest need to change.

Occupations in skill level 3, 4 and 5 require Certificate 4s and below. In aggregate these occupations faced less exposure, there are still some occupations in those categories with high exposure.

OCCUPATIONS WITH THE HIGHEST SKILL REQUIREMENTS HAVE THE GREATEST AI EXPOSURE

Generative AI is a general-purpose technology that will reshape the economy and the labour market

General-purpose technologies are technologies that can induce broad and profound impacts across various sectors of the economy. They possess the potential to drastically reshape industries, spark complementary innovations, and significantly influence productivity.

Historically, general-purpose technologies have been responsible for reshaping economies and societies. The transition from agrarian to industrial economies with the steam engine, or the creation of the digital economy with the internet, are testaments to this.

Generative AI could usher in new business models, shift labour markets as certain tasks become automated, augmented or adapted, and lead to societal shifts as it changes the way we create, consume, and interact with content.

Industry estimates of the impact of generative AI in Australia range from between \$45 billion to \$115 billion by 2030.

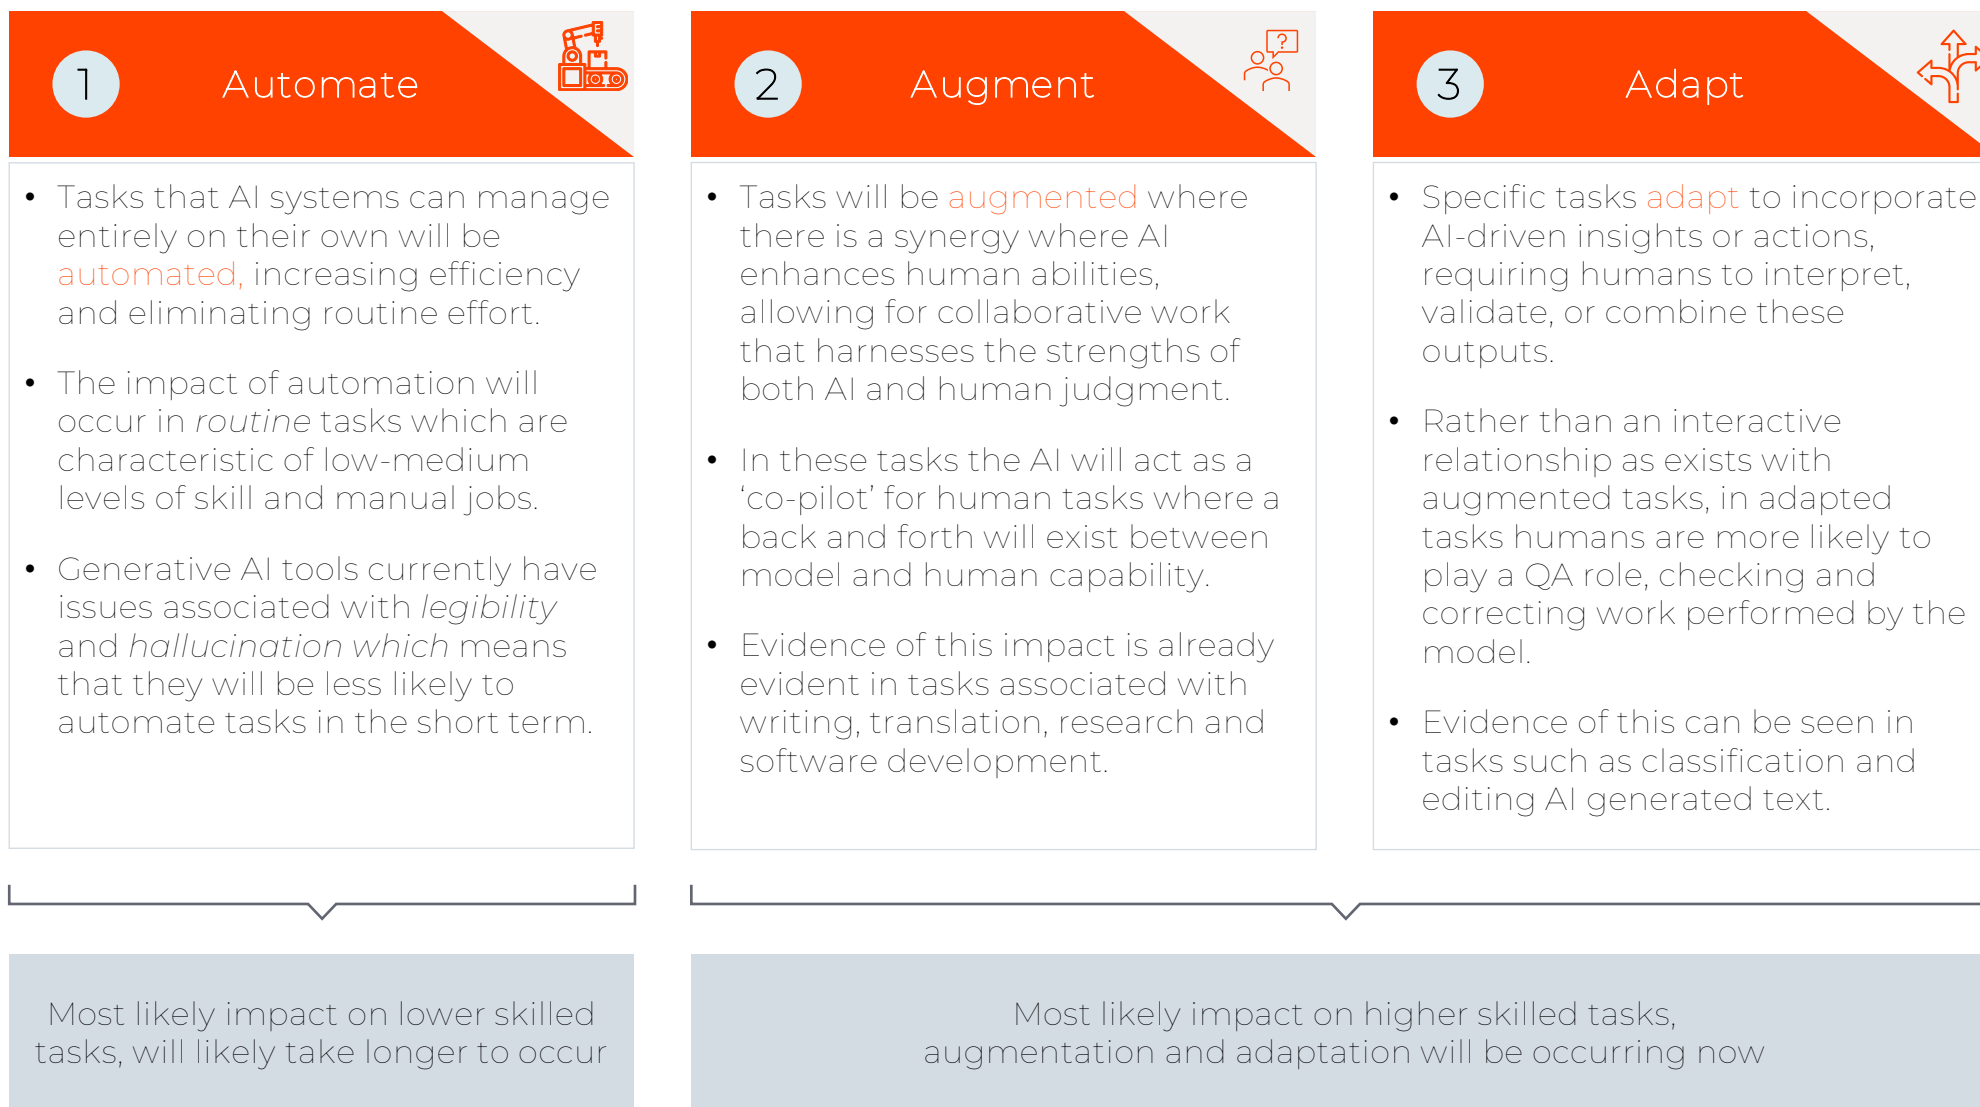

Generative Pre-trained Transformers (GPTs) are a general-purpose technology (GPT)

Criteria	Description	How it relates to generative AI
Pervasiveness 	Spread and adoption across a wide range of industries and tasks.	Generative AI is versatile and can be incorporated into various sectors, from entertainment (creating art/music) to finance (risk assessment) and beyond. Its algorithms can be adapted for numerous applications, making its reach expansive.
Innovation spawning 	Catalyses the development of ancillary technologies and methods.	Generative AI not only stands alone but also encourages advancements in other fields. For example, it boosts the development of more efficient computational hardware, inspires new data analysis techniques, and leads to novel AI architectures and methods.
Improvement 	Ability to evolve, mature, and increase in capability with time.	Like many AI technologies, generative AI is built upon iterative learning. As more data becomes available and as algorithms get refined, its accuracy, efficiency, and range of applications will grow, leading to a continually improving toolset.

To determine the impact on occupations and training products we use estimates of impact on human abilities

Human abilities are the building blocks that drive our capacity to perform tasks to achieve a given goal. The US Department of Labor has developed a systematic taxonomy of these abilities which it defines as the “enduring attributes of the individual that influence performance”.

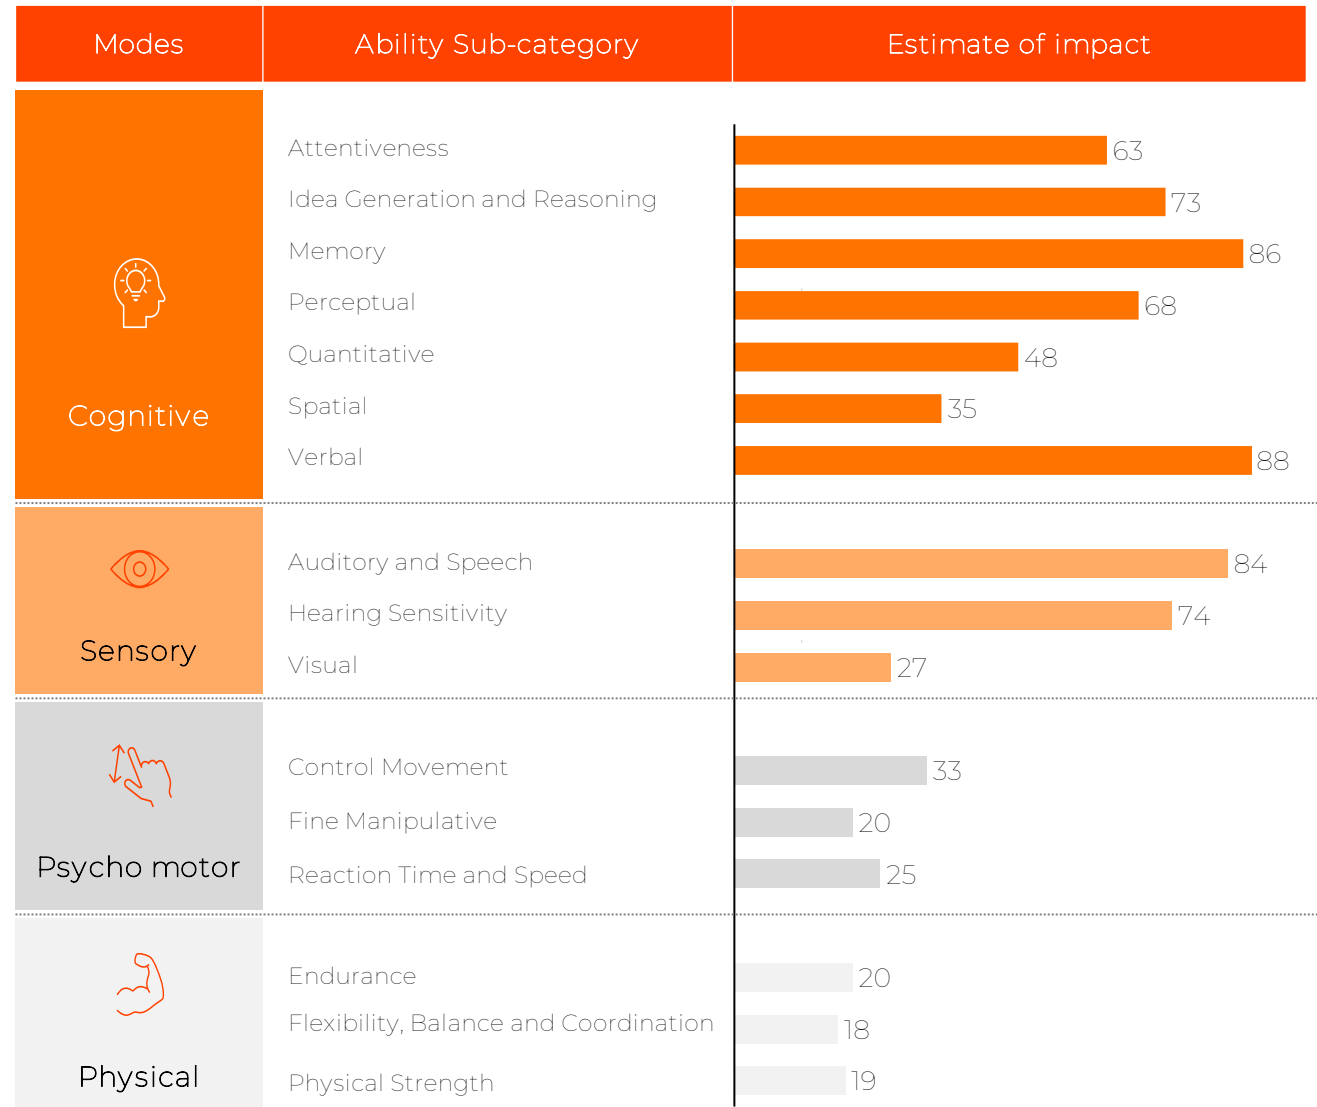

For each of these abilities, economic researchers have estimated how these abilities will be impacted by various forms of artificial intelligence.

For this study, we will be concentrating on the impacts of language models, which will have their strongest impact on cognitive and sensory abilities.

With these ability level estimates, we can then estimate the impact on other variables of interest such as occupations, industries and training products.

Cognitive and sensory abilities will be the most impacted by LLMs

Exposure of O*NET abilities to language models

*Source: Felten et al 2023, supra.

We map the ability estimates to other variables of interest such as occupations and training products

Approach	Output	Method	Considerations
<p>Occupation</p> 	<ul style="list-style-type: none"> AI exposure for each occupation Analysis at the ANZSCO 6-digit level of 108 occupations Used to determine the AI exposure of occupations that share characteristics 	<ul style="list-style-type: none"> Felten et al measured the occupational exposure to AI using Standard Occupation Classification (SOC), occupation classifications These were matched to ANZSCO occupations using the JSC correspondence and some imputation Characteristics of ANZSCO occupations were then derived from the Census 	<ul style="list-style-type: none"> Analysis of occupations is useful as they are easily relatable There are some ANZSCO occupations that are not covered by the SOC, the AI exposure score for these occupations was imputed based on similar occupations
<p>Qualification</p> 	<ul style="list-style-type: none"> AI exposure for each qualification Analysis at the qualification code level of 689 qualifications Used to determine the AI exposure of qualifications that share characteristics 	<ul style="list-style-type: none"> Felten et al measured the occupational exposure to AI using the SOC These were matched to qualification codes using the associated ANZSCO occupation provided by training.gov.au and the dataset above Characteristics of qualifications were then derived from NCVET VOCSTATS 	<ul style="list-style-type: none"> Analysis of qualifications is useful as they are the units that students engage with Each qualification is only associated with one occupation. However, AI exposure scores do not vary substantially between similar occupations so the results will not be substantially affected by this
<p>Unit of Competency</p> 	<ul style="list-style-type: none"> AI exposure for each unit of competency Analysis at the unit level of 1,867 units Used to determine the units of competency that are most in need of update 	<ul style="list-style-type: none"> Mandala scraping of training.gov.au for the Performance Criteria of every unit under the FSO An LLM was used to rank the O*Net abilities that are most required by each unit Using Felten et al's measure of O*NET ability exposure to AI, the exposure of each unit of competency was derived 	<ul style="list-style-type: none"> Analysis of UOCs is useful as UOCs are the base block in all training products This approach relies on the accuracy of an LLM to associate O*NET abilities with the Performance Criteria. To ensure accuracy, Mandala sampled a percentage of units to ensure classification accuracy

*Source: Felten et al 2023, ABS Census 2021, Mandala analysis

Within the VET system, higher level qualifications are more likely to face disruption

8

Higher level qualifications are more likely to have a higher level of AI exposure. This is because these qualifications are used in occupations that rely more heavily on cognitive and sensory skills.

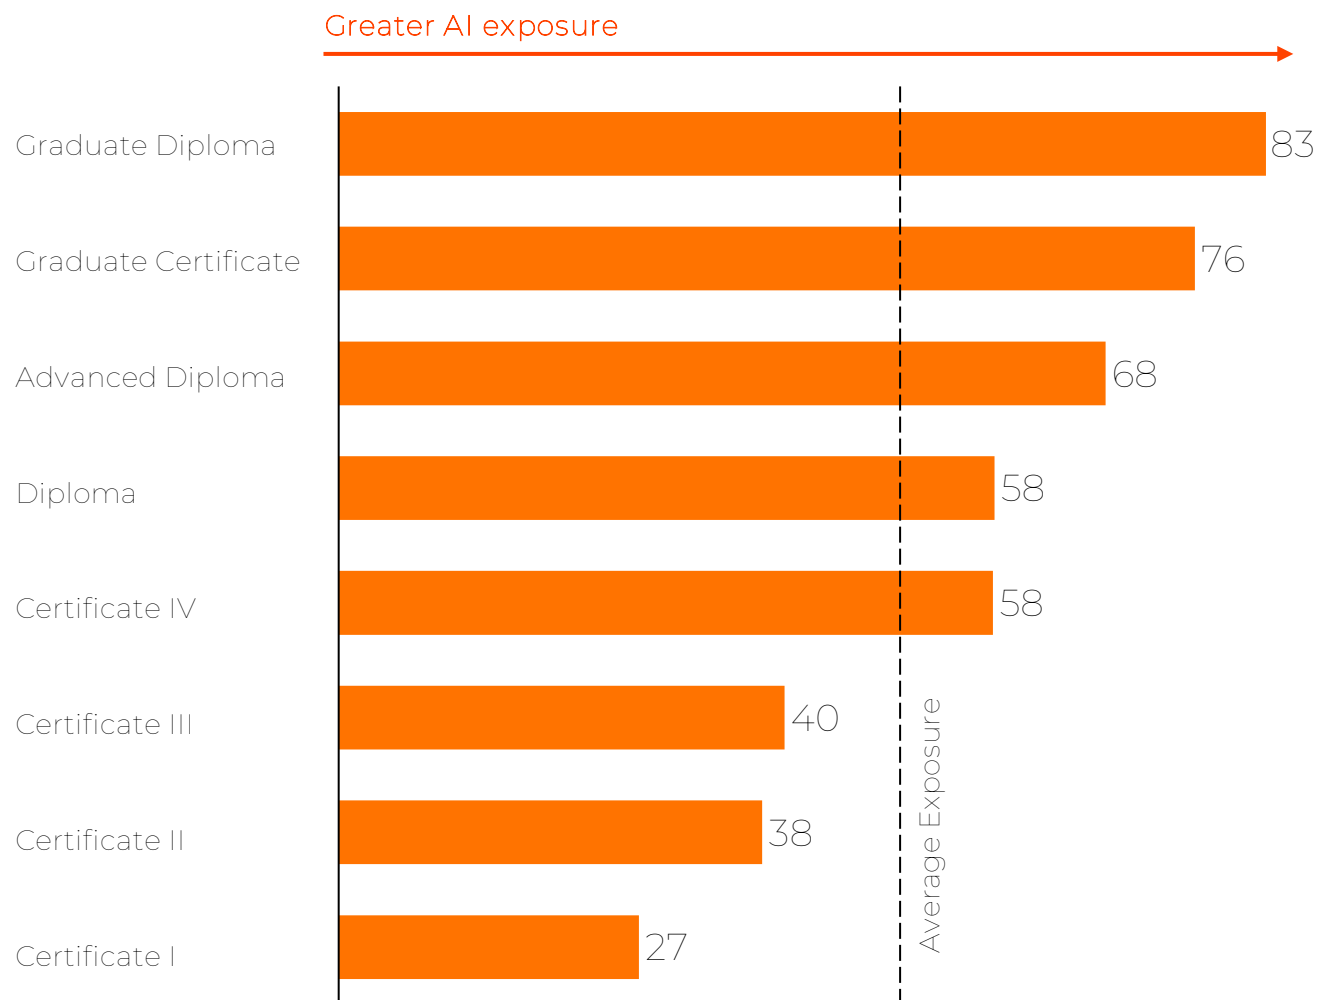

Graduate certificates and diplomas face greater AI exposure as they tend to be additional qualifications in management for exposed occupations like auditing and administration.

Other diplomas and Certificate IVs face a moderate exposure, driven by large qualifications with high exposure like the Diploma of Financial Services along with some low exposure qualifications.

Certificate Is, IIs, and IIIs face the lowest level of exposure. These qualifications face the lowest level of exposure as they tend to be required in occupations that rely more heavily on physical skills.

The graduate qualifications and Diplomas are the most impacted qualifications

Index, average of AI Occupational Exposure score by qualification type weighted by completed enrollments

Exposure across FSO packages varies, with financial services facing the greatest exposure

9

Across the three training packages administered by the FSO, the greatest exposure is faced in the Financial Services training package with ICT and Business Services following.

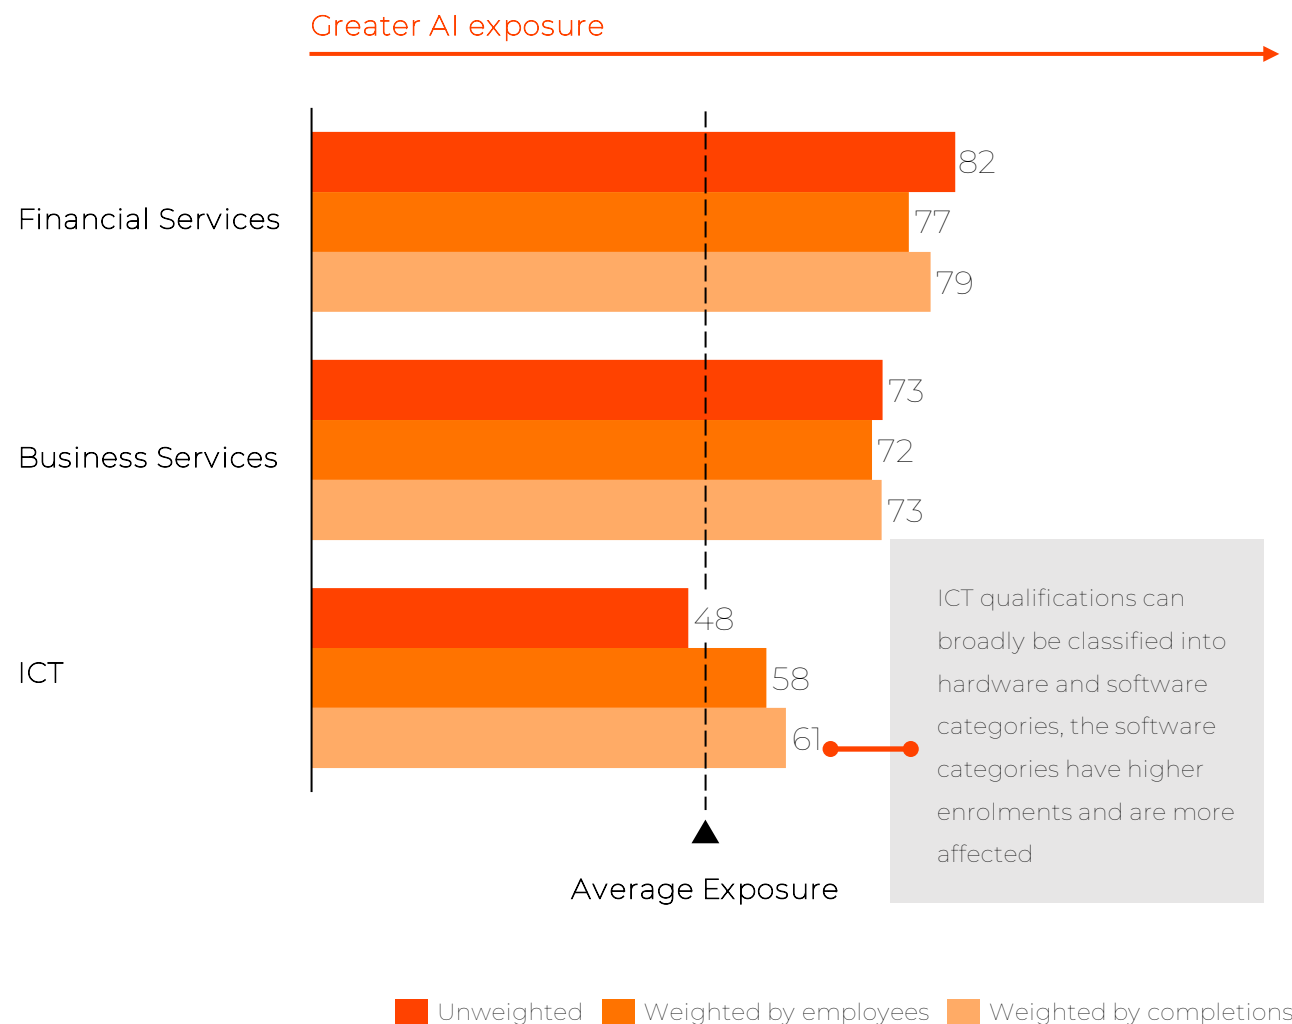

The Financial Services training package had 4,650 completions in 2022 and provides higher-level qualifications in insurance, banking and accounting. The greatest exposure is seen in qualifications preparing people for roles in accounting and clerking for financial services firms.

The Business Services training package had 24,290 completions in 2022 and provides qualifications across all levels in skills like customer engagement and administration. The greatest exposure is seen in administration and call centre roles.

The ICT training package had 3,970 completions in 2022 and provides qualifications in engineering for roles with hardware and computer science for software roles. Greatest exposure is seen in software development and programming roles.

The graduate qualifications and Diplomas are the most impacted qualifications
