Motivation behind this study

2 Theory

- 4 Research design & data
- 5 Empirical results

→ ∃ →

- Existing literature: PTA is an effective institution to solve commitment problem
- Flip-the-script: PTA is a tool to satisfy private interests

Why do some countries end up signing PTAs which include utterly unfavorable clauses to themselves?

- E.g., IPR regulations, sanitary/phytosanitary measures, labor regulations, etc. → hindering development of emerging economies (Markusen, 2001; Kenneth C. Shadlen, 2005)
- Pharmaceutical-relevant IPR clauses in Korea-US FTA and Transpacific Partnership

MNCs demanding IPR protection

- MNCs as major holders of IPRs (Bessen, 2017)
- MNCs seeking to extend monopoly to market overseas (Autor et al., 2020)

Securing IPR crucial to their success in monopoly

- MNCs lobbying for product-specific protection (Matilde Bombardini and Francesco Trebbi, 2012)
- Abundant resources concentrated among MNCs to buy off political influence (Huneeus and Kim, 2018; Bombardini and Trebbi, 2020; Cowgill, Prat, and Valletti, 2021)

- IPR protection VS emerging economies (Markusen, 2001; Kenneth C. Shadlen, 2005)
- Trade dependence of emerging economies on developed nations (Bhattacharya, 1976; Brenton, 2003; Manger and Kenneth C Shadlen, 2014)
- Emerging economies in fear of losing prominent market overseas

- 1. Firms are more likely to increase FDI only after recipient countries sign PTAs with IPR provisions. (Firm-FDI hypothesis)
- Countries with higher degree of trade network centrality are more likely to succeed in including substantive IPR protection in PTAs. (Centrality hypothesis)

<日

<</p>

- Firm-FDI hypothesis: M&A amount of firm i, 1993-2018
- Firm-year data on M&A from Bloomberg Terminal (Shim and Stone, 2022)

A B M A B M

Hypothesis 1 - Interaction-weighted (IW) estimator for cohort-specific average treatment effect on the treated (CATT) (Sun and Abraham, 2021)

- Treatment: Signing a PTA with IPR protection clause
- Treatment effect heterogeneity due to dynamic treatment timing

Empirical strategy (Cont'd)

1. Estimation of $CATT_{e,l}$:

$$Y_{k,t} = \alpha_k + \lambda_t + \sum_{e \notin C} \sum_{l \neq 1} \delta_{e,l} (\mathbf{1} \{ E_k = e \} \cdot D'_{k,t}) + \epsilon_{k,t}$$

 Estimate weights of each cohort by sample shares of each cohort in relative time periods *l* ∈ *g*:

$$Pr\{E_k = e | E_k \in [-I, T - I]\}$$

3. IW estimator:

$$\hat{v}_g = \frac{1}{|g|} \sum_{l \in g} \sum_{e} \hat{\delta}_{e,l} \widehat{Pr} \{ E_k = e | E_k \in [-l, T-l] \}$$

Results

Results

Figure: Interaction-weighted (IW) estimates for CATT on IPR adoption

・ 何 ト ・ ヨ ト ・ ヨ ト

- Directed dyads
- Human Development Index \geq 0.8 and GDP per capita \geq \$25,000 as cutoff for developed country status
- For convenience, country *i* can be understood as an FDI origin country and country *j* as an FDI recipient country.

- Hypothesis 2: IPR protection
- a dichotomous variable indicating whether a trade agreement signed in year *t* includes substantive regulatory provisions dedicated to IPR protection
- acquired from Design of Trade Agreements (DESTA) dataset listing reciprocal trade agreements in dyadic form, spans 2009 2018

- *Centrality*_i (eigenvector centrality of country *i* within the global trade network, ranging between 0 and 1)
- Trade networks are built for each year *t* weighted by logged import values obtained from DOTS dataset (Statistics Department, International Monetary Fund, 2021) flowing in the direction of country *i* from *j* within each dyad.

Hypothesis 2 - Bivariate probit with selection

- Observation of *IPR protection* being solely contingent upon PTA participation status selection bias issue
- 3 types of observations in the data
 - 1. dyadic pairs of countries that have no PTAs signed at all between themselves(PTA = 0)
 - dyads that signed PTAs without IPR clauses(PTA = 1 & IPR protection = 0)
 - dyads that have PTAs including IPR clauses(PTA = 1 & IPR protection = 1)

< 回 > < 回 > < 回 >

Empirical strategy (Bivariate probit, cont'd)

- 1st stage: $Pr(PTA = 1) = \Phi(Z\gamma)$
- 2nd stage: $Pr(IPR \ protection = 1, PTA > 0) = \Phi_{bn}(Z\gamma, X\beta, \rho)$
- Exclusion restrictions: *Contiguity*, *Distance* (Mayer and Zignago, 2011)

Table: Bivariate probit model with selection
