Conclusions

- The inverse credible commitment problem is a prevalent and salient issue
- The relation between asset mobility and government treatment is not monotonic
- Low asset mobility empowers foreign investors in many realistic scenarios

ELE NOR

국 동 김 국

Theoretical Predictions 1

(a) A predatory government will offer only a few foreign firms with the highest asset mobility the low tax rate when the competition level is low

I= nac

・ 同 ト ・ ヨ ト ・ ヨ

Theoretical Predictions 2

(a) A predatory government will offer all foreign firms the high tax rate when there is no competition

(b) A predatory government will offer only a few foreign firms with the highest asset mobility the low tax rate when the competition level is low

・ 同 ト ・ ヨ ト ・ ヨ

EL SQA

Theoretical Predictions 3

(a) A predatory government will offer foreign firms with medium asset mobility the low tax rate when the comptition level is intermediate (b) A predatory government will offer foreign firms with the lowest asset mobility the low tax rate when the comptition level is high

▲ □ ▶ ▲ □ ▶ ▲ □

E SQA

Identification

The Assumed Model:

$$\begin{aligned} \mathsf{Tax}_{i,t} &= \delta \cdot \mathsf{Asset} \ \mathsf{Mobility}_i + \eta \cdot \mathbbm{1}\{t = 2008\} \cdot \mathsf{Asset} \ \mathsf{Mobility}_i \\ &+ \beta \cdot X_{i,t} + \gamma \cdot Z_{i,t-1} + c_i + \alpha_t + \epsilon_{i,t} \end{aligned}$$

Identification:

 $\Delta_t \mathsf{Tax}_i = \mathbf{\eta} \cdot \mathbbm{1} \{ t = 2008 \} \cdot \mathsf{Asset} \ \mathsf{Mobility}_i + \beta \cdot \Delta_t X_i + \gamma \cdot \Delta_{t-1} Z_i + \Delta_t \alpha + \epsilon_i$

Prediction:

- $\eta > 0$: higher asset mobility firms pay more tax (my theory)
- $\eta < 0$: lower asset mobility firms pay more tax

Distribution of Effective Tax Rates

Figure: Distribution of Foreign Firm Effective Tax Rates in 2008

Heterogeneous Effects: Competition

H2: When intergovernmental competition for investments is more intense, foreign firms with lower asset mobility are more likely to receive better government treatment.

- Measuring competition intensity using within-province political competition in China
- Competition for higher political offices is closely related to local economic performance
- Within-province competition for foreign investments is closely related to global investment climate
- Intense political competition \implies intense competition for investment
- Measuring within-province competition intensity: the number of local leaders eligible for provincial leadership positions (more eligible leaders more intense competition)
- Data source: Chinese Political Elite Database (Jiang 2018)
- Prediction: competition ↑ ⇒ the positive effects of low asset mobility ↑

Heterogeneous Effects: Competition

competition $\uparrow \implies$ the positive effects of low asset mobility \uparrow

Figure: Heterogeneous Effects: Competition

Heterogeneous Effects: Time Horizons

H3: When government leaders have a longer time horizon, foreign firms with lower asset mobility are more likely to receive better government treatment.

- Measuring time horizons using term limits in the Chinese political system
- Each local leader can serve at most two five-year terms
- Time horizon = the number of years left in a five-year term
- Prediction: time horizons $\uparrow \implies$ the positive effects of low asset mobility \uparrow

<<p>A 目 > A 目 > A 目 > 目 = のQQ

Heterogeneous Effects: Time Horizons

time horizons $\uparrow \implies$ the positive effects of low asset mobility \uparrow

Figure: Heterogeneous Effects: Time Horizons

1.2

Confounder: Political Connection/Bribery

- Political Connection as a confounder
 - · Connected firms are more likely to invest in fixed asset
 - · Connected firms are more likely to pay less tax
- Since political connection and bribery are highly correlated in China, the positive effects of low asset mobility will be stronger when local leaders are corrupt if the effect can be explained by political connection/bribery
- Placebo test: compare local leaders who are arrested for corruption after 2008 with those who are not

313 990

Confounder: Political Connection/Bribery

If political connection is the cause, we will observe that local leaders corrupt \implies the positive effect of low asset mobility \uparrow

Figure: Confounder: Political Connections/Bribery

ELE SOC

A B M A B M

Confounder: 2008 Financial Crisis

- There were other significant events in 2008 such as the financial crisis
- Placebo: compare localities hit harder by the crisis with other localities
- I measure exposure to financial crisis using the city level export amount in 2007 (2007 export ↑ ⇒ hit harder by the crisis)

ELE NOR

Confounder: 2008 Financial Crisis

If the financial crisis is the cause, we will observe that: city export amount $\uparrow \implies$ the positive effect of low asset mobility \uparrow

Figure: Confounder: 2008 Financial Crisis
