The Clinical Approach to Suicidality and Dignity at End-of-Life

www.pcceef.org
High Rates of Suicide

2003: Oregon has one of the highest rates of suicide in the elderly in the nation.

Firearms were the lethal means to 80% of suicide deaths among elderly Oregonians.

Other mechanisms included suffocation, poisoning, and multiple mechanisms.

Suicide Rates by Age Group and Sex
Oregon, 2003 (n=122)

Source: Oregon Violent Death Reporting System
What happens when someone asks you about Assisted Suicide

• Don’t avoid this conversation
  – If we respond by avoidance, this can be interpreted as rejection
  – Failure to hear a “cry for help”
  – Need to ask “Why?”

• They may just be curious

• May indicate a clinical depression
Late-Life Depression is often unrecognized, undiagnosed, and left untreated

- 5% of community (age > 65)
- Nursing home residents
  - Depressive Symptoms: 30% - 50%
  - Major Depression: 15% - 38%
  - Dysphoria is common at admission
  - Incidence is very high (15-30% each year)
  - Depression increases risk of death
Late-Life Depression: Why is it so challenging for us?

What makes depression in the elderly so insidious is that neither the victim nor the health care provider may recognize its symptoms in the context of the multiple physical problems of many elderly people.

NIH Consensus Development Panel on Depression in Late Life
We Don’t Diagnose Geriatric Depression

- Old people are depressed
- The nursing homes are depressing
- Sick people should be depressed
- Somatic complaints
- Lost in the biomedical issues
- Apathy is not bothersome for caregivers
Defining Depression (DSM-IV)

1. Two or more weeks of depressed mood or interest
2. Four of eight other symptoms: SIGECAPS
   - **Sleep** increase/decrease
   - **Interest** pleasurable activities diminished
   - **Guilt, low self esteem**
   - **Energy** poor
   - **Concentration** poor
   - **Appetite** increase/decrease
   - **Psychomotor** agitation or retardation
   - **Suicidal ideation**
Geriatric Depression may be different

<table>

</tbody>
</table>
Geriatric Depression

- 80% improve with appropriate Rx treatment
- 50% are inadequately treated (< 6 months)
- Compliance (as high as 70%)
- For mild to moderate depression
  - Psychotherapy is equivalent to pharmacotherapy, and both are superior to no treatment or usual care
  - Combination treatment (psychotherapy & pharmacotherapy) is superior to either alone
Depression and Stroke

- 20-40% of post-stroke patients suffer from depression
- More than 40% experience depression within first month
- Has a negative impact on recovery
- Increases mortality (70% higher)
- Meta-analysis: SSRI, TCA, MAO inhibitors effective
  - Only 9 studies, SSRI showed significant improvement
  - Significant dropouts using TCA
  - Important to have long-term treatment

Bhogal et al. JAGS. 2005 53:1-51-57
Bereavement

- 800,000 new widows (widowers) each year
- Most exhibit varying degrees of symptoms
- Most benefit from self-help / group support
- 30% meet criteria for major depression in the first month after the death, about half of those are still depressed at one year.
# Medications for Depression

</tr>
</tbody>
</table>
Antidepressants to Avoid

- Amitryptiline
- Doxepin
- Clomipramine
- Imipramine
- MAO Inhibitors

Tertiary Amine Tricyclics.
Pharmacotherapy of Late-Life Depression

• 80% improve on medication

• Drug interaction (P-450 system)
  – CYP2D6 mediates the metabolism of antiarrhythmic agents, antipsychotics, beta-blockers, TCAs, codeine
    • Inhibited by fluoxetine, and paroxetine.
  – CYP3A3/4 metabolizes calcium channel blockers, carbamazepine, pimozide, alprazolam.
    • Inhibited by fluoxetine and nefazodone.
Medication Therapy

• Treatment should be maintained for at least 6 months after remission of a first episode of major depression.
• Treatment should be maintained for at least 12 months after remission of a second or third episode of major depression.
Remember

• Not everything needs to be treated with medication
• Start at a low dose and titrate slowly
• Not everything needs to be treated with medication
Severe Geriatric Depression

- Pharmacotherapy and combination therapy is superior to psychotherapy alone for more severe depression.
- Electroconvulsive therapy is effective, but is typically reserved for patients who have not responded to pharmacologic interventions.
When to Refer to the Psychiatrist

- Severe depression (weight loss or malnutrition)
- Severe depression with high suicide potential
- Failed trial(s) of antidepressant
- Psychotic Features
Suicide prevention

- Move severely depressed to a location where they can be monitored
- Monitor suicidal ideation – ask
- If suicidal plan, hospitalize
- Ensure they are not stockpiling medication
- Weapons out of the home
Dementia vs. Depression

• Dementia can be an initial manifestation of a clinical depression
• Dementia can be associated with severe depression
• Depression that causes dementia is often associate with psychomotor retardation
• This type of dementia has abrupt onset
• You can have both dementia and depression
Depression vs. Dementia

• 30-40% of patients with dementia will have significant depression at some point
• High rates of depression in Parkinson’s
• Misdiagnosis of dementia as depression
  – Failure to assess cognitive functioning
• NEED early diagnosis of dementia
  – Allows for specific therapy
  – Allows the family time to explore resources
Pseudo-Dementia

- Some sharp or compulsive persons notice a normal slipping with age
  - Slowed recall of new data
  - Problems with word-finding, misplacing things
  - Not interfere with normal daily functioning
  - Can be pre-occupied with this
  - No complaints from others
  - Younger patients
  - Difficult distinction (may need testing)
# Depression vs. Dementia

<table>

</tbody>
</table>
Dementia Definition

- Multiple cognitive deficits:
  - Memory dysfunction (especially new learning)
  - At least one additional cognitive deficit (aphasia, apraxia, agnosia, or executive dysfunction)

- Disturbances are sufficiently severe to cause impairment of occupational or social functioning

- Course shows gradual onset and decline

- Not due to other CNS conditions or substances

- Do not occur exclusively during delirium

- Not due to another psychiatric disorder

Diagnostic Criteria For Dementia Of The Alzheimer Type  (DSM-IV, APA, 1994)
Differential Diagnosis: Top Ten

(mnemonic device: AVDEMENTIA)

1. Alzheimer Disease
2. Vascular Disease
3. Drugs, Depression, Delirium
4. Ethanol
5. Medical / Metabolic Systems
6. Endocrine (thyroid, diabetes), Ears, Eyes, Environment
7. Neurologic (primary degeneration, Lewy body dementia, Parkinson component)
8. Tumor, Toxin, Trauma
9. Infection, Idiopathic, Immunologic
10. Amnesia, Autoimmune, Apnea, AMI
Alzheimer’s Disease

• A diagnosis of Alzheimer’s Disease can be made with a high degree of certainty

• Accuracy in autopsy-verified cases is approximately 90%

• Diagnosis is a 2-step process:
  – Detection through screening (MMSE)
  – Confirmation through patient history and physical, caregiver interview, brain imaging, and appropriate laboratory studies

Ashford JW et al, Psychiatric Annals, 1996;26:262-268
Dementia Assessment

• History
  – Patient and family, onset, unusual events (stress, trauma, surgery), progression, activities of daily living

• Complete Physical Examination

• Routine Tests
  – CMP, CBC, ESR, Thyroid, B-12, Folate, VDRL, HIV
  – EKG and CXR (if indicated)
  – URINALYSIS

• Brain Imaging
  – CT (cheapest)
  – MRI (preferred)

• Neuropsychological Assessment
  – Allen cognitive testing
What about Dignity?

dign·i·ty: (dĭg'nĭ-tē)

- The quality or state of being worthy of esteem or respect.
- Inherent nobility and worth:
  - Poise and self-respect.
  - Stateliness and formality in manner and appearance.
- The respect and honor associated with an important position.

American Heritage Dictionary
There are Two Kinds of Dignity

• Attributed Dignity (personal dignity)
  – Perception of autonomy, independence, and individualism
  – Factors that diminish attributed dignity
    • Pain
    • Bowel Dysfunction
    • Dependency Issues
    • Physical Appearance Changes

Chochinov, Lancet 1999
Intrinsic Dignity

Intrinsic Dignity is the moral quality inherent in human life which is inalienable from “core being” or “essence”
How to Preserve Dignity

• Need a “Dignity Conserving” approach to care
  – How patient/family perceive dignity
  – Symptoms: need to be vigilant
  – Bolster independence: equipment

• Dignity conserving strategy:
  – Hard to do in face of deteriorating health
  – Therapeutic stance: respect for whole person, feelings, accomplishments, and passions that are independent of illness
Dignity Model

- Illness-Related Concerns
  - Level of Independence
  - Symptom Distress
- Dignity Conserving Repertoire
  - Dignity Conserving Perspectives
  - Social Dignity Inventory
  - Dignity Conserving Practices

Chochinov CA: Cancer J Clin 2006
Illness Related Concerns

• **Symptom Distress**
  – Physical Distress
  – Psychological Distress
    • Medical Uncertainty
    • Death Anxiety

• **Level of Independence**
  – Cognitive Acuity
  – Functional Capacity

Chochinov CA: Cancer J Clin 2006

Dignity Therapy: A Novel Psychotherapeutic Intervention for Patients Near the End of Life

Harvey Max Chochinov, Thomas Hack, Thomas Hassard, Linda J. Kristjanson, Susan McClement, and Mike Harlos

- Pre and post-intervention measures after a 30-60 minute bedside session for 100 terminally ill patients in Canada and Australia
  - 91% reported being satisfied with dignity therapy
  - 76% reported a heightened sense of dignity
  - 68% reported an increased sense of purpose
  - 67% reported a heightened sense of meaning
  - 47% reported an increased will to live
  - 81% reported that it had been or would be of help to their family.

- CONCLUSION: This shows promise as a novel therapeutic intervention for suffering and distress at the end of life.
Conserving Dignity Psychotherapy Protocol

• Tell me a little about your life history; particularly the parts that you either remember most or think are the most important?
• When did you feel most alive?
• Are there specific things that you would want your family to know about you, and are there particular things you would want them to remember?
• What are the most important roles you have played in life (family roles, vocational roles, community-service roles, etc)? Why were they so important to you, and what do you think you accomplished in those roles?
• What are your most important accomplishments, what do you feel most proud of?
• Are there particular things that you feel still need to be said to your loved ones or things that you would want to take the time to say once again?
• What are your hopes and dreams for your loved ones?
• What have you learned about life that you would want to pass along to others? What advice or words of guidance would you wish to pass along to your (son, daughter, husband, wife, parents, other[s])?
• Are there words or perhaps even instructions that you would like to offer your family to help prepare them for the future?
• In creating this permanent record, are there that you would like included?
What to do when faced with a request for doctor-assisted suicide

- Most important thing is to connect with this person
- First priority is relief of suffering and symptoms
- Screen for depression, treat if indicated
- Use the dignity conserving interventions
- Establish short term goals
- Explore options for end of life care
- Involve care manger, family, and caregivers
- Withhold / Withdrawal of life sustaining measures
- Walk with them on this last part of their journey
Dignity Preserving Psychotherapy Protocol and Legacy Discussion

These questions are to be used as a starting point for a discussion or as a way to stimulate further discussion of Legacy issues for patients near the end of life. Please put these into your own words. Do not consider this as a complete list, but rather as a launching point. Remember that your patient’s life has inherent value, and your job is to discover this and help families and loved ones do the same.

Can you tell me a little about your life history?
When did you feel most alive?
Are there specific things that you would want your family to remember about you?
What are the most important roles you have played in life?
What are your most important accomplishments, and what do you feel most proud of?
Are there things that still need to be said, or that you would want to say once again?
What are your hopes and dreams for your loved ones?
What have you learned about life that you would want to pass along to others?
What advice or words of guidance would you wish to pass along to your (son, daughter, husband, wife, parents, other[s])?
Are there words or perhaps even instructions you would like to offer your family, in order to provide them with comfort or solace?
In creating this record, are there other things that you would like included?
