

BROADWAY

GERMANIUM PREAMP & TREBLE BOOSTER

TONE SWITCH

Neck (left) - The warmest position, which allows bass signal to be amplified.

Middle (center) - The most neutral position, closest to a bandpass setting.

Bridge (right) - The brightest position, which allows mids and highs to be amplified.

OUT 9V

IN

VOLUME

Sets the overall output level, ranging from a full cut to a strong, overdriven boost.

SMART BYPASS™

A tap of the footswitch will engage the pedal as normal, but holding down the footswitch will activate momentary mode. The design of our relay-based bypass network allows for the signal to pass through unaffected, should the pedal lose power.

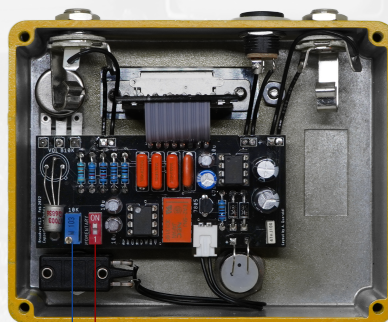

INTERNAL TRIM POT

For the real tweaker. The internal trim pot adjusts compression and dynamics. It also can help to reduce any harsh high end. Broadway comes set at optimal settings.

MOMENTARY DIP SWITCH

When set to "ON", our SMART BYPASS™ system is engaged. To turn this off, simply switch the DIP down to the "1" position.

IN/OUT: 1/4" Inst. Cable

POWER CONSUMPTION: 9V 30mA Consumption

Standard 2.1mm x 5.5mm center negative power supply. Broadway has internal polarity protection. We recommend using an isolated power supply over daisy chain options.
Disclaimer: Using buffered pedals in conjunction with Broadway may yield varying results.
